About these Materials

Welcome to the Transforming Teacher Education and Learning Professional Development Guide for Tutors.

Transforming Teacher Education and Learning (T-TEL) is a Government of Ghana programme seeking to increase learning outcomes - for tutors in Colleges of Education, their student teachers, and above all for pupils in school. To that end, T-TEL has created a set of professional development resources for use by you, the tutor, for in-service college-based professional development.

The resources are organised into twelve themes focusing on pedagogy and effective college classroom practice, such as creative approaches, questioning, group work, Assessment for Learning, Leadership for Learning, enquiry-based learning, gender, inclusion, and many more. The themes have been chosen because of their relevance to improving learning outcomes through the use of active pedagogies. For each of the twelve themes there are different teaching strategies (or teaching approaches). For instance, the teaching strategies in the theme “Creative Approaches” are songs, role-play, modelling, games, storytelling, poems and rhymes, and play.

For each of the strategies within a theme, the resources consist of three sequences of “Example - Plan - Teach - Reflect” (EPTR): one focusing on English, one on mathematics, and one on science. Many topics taught in the syllabus of the Diploma in Basic Education draw those subjects, and you should find the examples useful irrespective of the course you teach.

Within each “EPTR” sequence there is an example for the use of the strategy (e.g. an example for using songs in English), followed by a section to support you in planning an activity using the strategy (e.g. planning the use of modelling in mathematics, or planning the use of role-play to illustrate an idea in science). You can then try out your activity (by teaching it to your student teachers) after which you will find a number of activities for reflection, prompting you to think about your experience. For example: Did the song achieve the intended learning outcomes? Did everybody (including girls and boys) participate in making the models? What can I do to involve learners with special needs?

The resources are self-contained, and can be used for self-study. However, within T-TEL, the resources are used within a structured, three-year tutor professional development programme, facilitated by college-based professional development coordinators. Research shows that such extended professional programmes are essential for achieving improved learning outcomes, and we encourage you to review the additional T-TEL materials available, detailing the elements of the professional development programme itself. There is good evidence for the importance of learning together in “communities of practice”. If no college-wide or school-wide programme is available to you, we recommend that, at the very least, you work together with colleagues in self-organised study groups.
Theme 2: Questioning

For each theme, the teaching strategies are presented together in a single book (in print), but are also available online on the T-TEL website in various formats (such as HTML, ePub, PDF) alongside supporting information. All T-TEL resources are Open Educational Resources (OER), available under a Creative Commons Attribution Share-Alike licence. This means that you are free to use and adapt them as long as you attribute T-TEL and retain the same licence. In fact, we have used that same process to develop these materials from other OER that are available, such as the TESSA Ghana materials, and the OER4Schools programme.
Introduction to Theme 2
Questioning

Why does it get dark at night? Why is the sky blue? Why do cars have wheels? Children ask questions all the time. All of us do. Questions feature in most conversations and dialogue. So it is no surprise that questioning is a big part of any classroom environment and accounts for a high proportion of talk in the classroom.

Tutors and student teachers use questions for a wide range of purposes. They are a way of establishing existing levels of understanding or assessing the learning that has taken place during a lesson or at the end of it. In this way, question and answer techniques are essential for understanding the learning process. Questioning is also a powerful tool to help student teachers acquire basic knowledge and developing higher-order thinking skills, such as application, analysis and evaluation. It also facilitates problem solving.

Questions may be asked by student teachers as well as tutors. Helping student teachers develop their own ability to ask questions and knowing which questions to ask are important elements of their teacher education.

Sometimes questioning can work well, and lead to lively and purposeful discussion. At other times a questioning sequence is simply repetitive with little learning taking place. Education research provides some insights into how to make questioning more effective for learning. For instance, a common problem is the lack of ‘thinking time’ (or ‘wait time’) a tutor gives the student teachers to come up with an answer. Another issue is asking too many of the same type of questions.

Questions can follow a set pattern that is not productive for learning. One such pattern is called Initiation-Response-Feedback exchange, abbreviated as IRF. Here’s an example:

Initiation (tutor): What’s the capital city of Ghana?
Response (student teacher): Nairobi
Feedback (tutor): No, that’s not right. Who can tell me?

Initiation-Response-Feedback is used widely in classrooms, but it is just about checking the facts. It often only involves a handful of student teachers, usually those that are quick to raise their hands.
This theme on questioning will explore how to ask more productive questions that involve more student teachers, so that in turn, they can use it when they enter the classroom and begin questioning pupils.

Important aspects of questioning are:

• the purpose of questions;
• the form in which questions are asked;
• the ways in which tutors handle responses.

**Tutor Discussion**

An important element of this programme is active learning. So rather than just reading the above text, let us ask some questions: *What do you think are the reasons for asking questions in a learning environment? Discuss your ideas with a colleague.* Write down your thoughts in your learning journal.
### Theme Overview

#### Questioning

### Learning Outcomes for the College Tutor

**You will:**

- have skills in the array of communication skills to motivate, manage, encourage, and develop co-operative learning with student teachers;
- question and draw together student teachers’ contributions to help them learn;
- use questioning techniques skilfully;
- interpret, reflect on, and act on student teachers’ responses;
- teach concepts through activities that are student teacher-centred;
- use questioning to support student teachers in developing concepts;
- appreciate the importance of questioning to support learning;
- understand the differences between closed and open questions and how each can be used effectively;
- use open-ended questions and discussion to promote student teachers’ thinking;
- identify common mistakes associated with questioning;
- know how to use questioning to promote thinking;
- understand how questions can be used to investigate misconceptions;
- deploy strategies to involve all students in questioning.
Teaching Strategy 1
Questioning to Support Learning

When you ask a question, what do you expect the answer to be? Many questions focus on recalling facts by asking ‘right’ or ‘wrong’ questions. Knowing some facts is important. However, focusing only on recalling facts, rather than on students’ understanding, does not promote learning effectively. In this teaching strategy, we look at how we can adjust the way we ask questions and how we react to responses to support student teachers in their learning.

One way to move away from ‘right’ and ‘wrong’ answers is to think of sequences of questions: when you get an answer, ask a follow-up question. For example, imagine that a student teacher has just responded to a question. The answer may be correct, or it may be wrong. You can follow up this answer by asking “Why do you think this is correct?” or “Does everybody agree?”.

Here are some more examples of follow-up questions:

- Why?
- How did you arrive at this?
- Can somebody think of another way to answer this question?
- Does everybody agree? Who disagrees?
- Can somebody suggest a better word?
- Can you provide some evidence to substantiate your answer?
- What would happen if . . . ?
- Is this always the case?

Such sequences assist and encourage your student teachers to say something and to engage in discussion. We call this “prompting”. It is about using follow-on questions that help student teachers to develop and improve the previous answer.

Listening carefully to responses from your student teachers helps you notice unusual or innovative answers that you may not have expected. They may show a new approach that you had not considered, but they may also highlight misconceptions that need addressing. Wrong answers can be very helpful to you as a tutor: it gives you an insight into your student teachers’ thinking.
How you deal with your student teacher responses to the questions is important as well. It can help in maintaining motivation and involving all in learning. Listening carefully and responding supportively will make your student teacher feel valued, and empower them to think and try more. For example you could say “I hadn’t thought of that. Tell me more about why you think that way”. Asking student teachers to explain further will give you both the opportunity to get an insight into the understanding of the student teachers and expose misconceptions. If you do this for all answers, right or wrong, student teachers will often correct their own mistakes. You will really get to know what and how your student teachers have learned and this will help you in planning what to teach next.

| Learning Outcomes for Tutors | By the end of the session the tutor will be able to:  
                          • Identify question types  
                          • Use these questions to encourage learning  
                          • Identify strategies that can make a lesson more interactive to support learning. |

Example

Questioning to Support English Language Learning

A tutor is modelling a reading comprehension lesson with their student teachers. The passage they are using is entitled ‘The Murder of Mallam Maikudi’.

Read the scenario below and then answer the following questions.

1. What types of question does the tutor use at the start of the lesson?
   What types of question does the teacher use during and after reading?
2. How does the tutor make the lesson interactive and support learning? What strategies do they use?

3. How does the tutor respond to their student teachers?

Use the table for your answers to the questions.

<table>

</tr>
</tbody>
</table>

The Murder of Mallam Maikudi

For this activity you will need the reading - 'The Murder of Mallam Maikudi', which can be found in New Gateway to English for Junior High School, Student Book 2, published by Pearson. The story is about Mallam Maikudi, a rich man, who is found murdered in his shop. Two inspectors investigate the scene of the crime, observing various facts, including a footprint leading away from the shop. The inspectors trick a number of suspects into leaving footprints, which helps them identify the murderer. If you do not have this story available, you could choose another story to fit the type of activities outlined below.
The tutor starts the reading comprehension activity by writing the title on the board, ‘The Murder of Mallam Maikudi’, and then hands out the reading to the class.

**The Activity**

Having handed out the reading, the following activity takes place:

**Tutor (T):** I want one of you to read the title. (A student teacher volunteers to do so and reads it.) Good.

![Diagram](image-url)

*Figure 2. Aspects of 'The Murder of Mallam Maikudi': A questioning web to elicit prediction answers from the students*

T: Now, read the passage silently for ten minutes. (She now asks the students to answer some questions on the passage.)

T: How many people were arrested by Inspector James?

(Kojo: Three people/men.)

T: Where can the answer be found? (This time more pupils raise their hands. T calls Abu)

Abu: The last but one paragraph.

T: Good! What did the Inspector see in the soft sand beneath the window?

(More pupils volunteer)

Yaa: Footprints.

T: Where can this be found?

(Dela: In the third paragraph. (She reads it to the class.)

T: Why did Inspector James say the footprint would disappear?

Ayi: The thieves will come back to clean it.

T: Does someone have a different answer?

Edna: The wind will blow the sand over it.

T: These are very good answers. Can we still have some more? (Students add...
other ideas)
You’ve all done well. Why did the thieves use the back window?
**Dede:** Because the door was locked.
**T:** Great. Any other answers?
**Ekuba and others:** They didn’t want to be seen entering the shop/breaking the door down will make noise etc.
**T:** Well done. Now fill in the table below with your own adjectives to describe the characters in the passage.

<table>
<thead>
<tr>
<th>NAME OF CHARACTER</th>
<th>ADJECTIVE(S)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mallam Maikudi</td>
<td>Miser, wicked</td>
</tr>
</tbody>
</table>

The tutor then goes on to develop a role-play:

**The Murder of Mallam Maikudi**
(In groups of six.) You all live in Mallam Maikudi’s town. One person is the Inspector, and the rest of you are the people in the town. What will you do when you all wake up in the morning and find the dead body of Mallam Maikudi in front of his shop? Some people also talk about Mallam Maikudi’s wickedness.

For example:
**Inspector:** Good morning, what happened here?
**Woman:** We woke up and found a dead body here. . . .

**T2-1 E 2** Plan and Practise together

**Questioning to Support English Language Learning**
Here are your planning tasks. You can use the activity plan template found in the Appendix.

1. In groups think of a lesson and a topic that you will teach in the coming week and find the specific materials you will use.

2. Plan the questions you will use in your lesson. Think about different types of questions.

3. Indicate the types of questions and strategies used to elicit information from the students.

4. Plan strategies you will use to get the whole class to participate in the discussion of the topic.

5. Plan the strategies you will use to elicit information from the students, for example, motivation, use of visuals etc.

Please make sure that you have noted down everything you need to remember for your lesson in your activity plan.

T2-1 E 3 Teach

It is important for your professional learning that you actually teach the activity that you have planned. Please make sure you have your own activity plan available when you teach. Also make sure that you note down any issues that arose during the lesson immediately after you have taught. In particular, remember to fill in your observations section of the activity plan immediately after you have taught.

T2-1 E 4 Reflect together

Questioning to Support English Language Learning

Now that you have taught the lesson activity, reflect on how it went. If at all possible, do the reflection together with a colleague who has also tried the activity. In your reflection, consider the following questions:

1. What strategies did you use to elicit information from your student teachers?

2. What types of questions did you use to make your class interactive and support learning?

3. How did you help your student teachers develop eliciting skills to get information from pupils?
4. Why do you think it is important for a tutor/teacher to plan the questions to be used in class?

5. Is there any difference between this strategy and what you already do/know? Describe it here.

Make brief notes about your reflections in your learning journal.

T2-1 E 5 Other Resources

Questioning to Support English Language Learning

Planning your Questions

Here are some questions you can use about your questions:

- Does this question have one correct answer?
- Is there more than one answer to this question?
- Are you using this question to get a student to give you a particular answer?
- Could a student come up with the answer through their own thinking, or is it something that they either know or don't know?
- If the question is answered by somebody, would it be possible for somebody to object to the answer, and come up with a different answer (that can be justified, or one that at least isn’t easy to dismiss).
- Also try to answer the question yourself: Is it a productive question? You could also test your question on a peer/colleague: Again, how do they answer the question?

Here are some questions you can ask in class:

- Can you guess what will happen (next)?
- Can you give me an example? Can you find an (another) example?
- How does this explain ...?
- Is this the same as ...? Is this different from ...?
- Tell me something that is true about ...
- What connections can you see between ...
- What always seems to happen?
- What other ways are there to . . . ?
- What do you think is happening?
- What would happen if ...?
- What could be changed if we want...? What would you change so that...?
- What is wrong with ...?
• What happens when ...?
• What did you observe?
• What do you think about ...?
• What do you think about what X said? Why?
• Why do you think that ...?
• Can you explain that to your partner?
• Can you group these?

Example

Improving Questioning to Support Mathematics Learning

Maths tutors Gloria and Opoko had been to the PD session on ‘questioning to support learning’ and were discussing their current practice on questioning. They both realised that they were not really aware of what questions they were asking in their classrooms, and how they were really responding to questions and answers from the student teachers. They agreed that as a first step they would come and observe each other’s lessons to help with that. They would record the questions that were asked, responses that were given, gestures of the tutor, position of standing or moving around, time spent on questioning, the length of time the tutor spoke and the length of the time the student teachers could speak.

With the help of the record of these lesson observations, Gloria and Opoko were able to identify what they each wanted to focus on first to improve their questioning skills. Gloria wished to work on developing follow-up questions: she felt that she missed quite a few opportunities for the student teachers to learn from each other, and to probe their thinking, by not asking follow-up questions. This also meant that she should develop her listening skills to understand better what the student teachers were thinking. Opoko noticed that his lessons were not very interactive: they tended to consist of an explanation (though very good and clear) on how to do the maths, using ‘right’ or ‘wrong’ questions at times to check understanding, followed by student teachers doing lots of exercises on their own to apply and practise the newly-learned mathematical technique.
Gloria and Opoko were not teaching the same mathematics courses, but they managed to help each other to come up with a list of strategies that they could try out in their own lessons:

<table>
<thead>
<tr>
<th>What I am trying to change...</th>
<th>Gloria</th>
<th>Opoko</th>
</tr>
</thead>
<tbody>
<tr>
<td>To ask follow-up questions: I am missing opportunities for the student teachers to learn from each other and to make them think more deeply. To develop my listening skills so I have a better insight into what my student teachers are thinking</td>
<td>Use this list of questions (and write this in my activity plan): Why? How did you arrive at this? Can somebody think of another way to answer this question? Does everybody agree? Who disagrees? Can somebody suggest a better mathematical word? Can you provide some evidence to substantiate your answer? What would happen if...? Is this always the case?</td>
<td>To make my lessons more interactive. To avoid explaining things, relying on right and wrong questions, and enabling student teachers to do exercises by themselves. Use this list of questions (and write this in my activity plan): Why do you think this is? Can somebody think of another way to solve this problem? Can somebody suggest a better mathematical explanation? Can you provide some evidence to substantiate your answer? What would happen if...? Is this always the case?</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>The questions I will use to change this...</th>
<th>Gloria</th>
<th>Opoko</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ask the student teachers to first discuss their answers in pairs. Ask the student teachers themselves to come up with follow-up questions to ask each other</td>
<td>Ask students to work in pairs or groups for doing a selected number of exercises. Then ask them to discuss what was the same and what was different between the exercises and how that affected the mathematical techniques they were using. Start with posing the mathematical problem and ask the student teachers to come up with a solution to solve it instead of me giving an explanation straight away.</td>
<td></td>
</tr>
</tbody>
</table>

Other teaching strategies I could use...
Discuss with your tutor colleagues:

• What are the advantages and disadvantages of using peer-observation to learn more about your own practice? Would you use it? Can you think of some alternative strategies?

• How do the things Gloria and Opoko want to change relate with your experiences? Would you focus on other things?

• What do you think about the questions and teaching strategies Gloria and Opoko have selected to work on changing their practice? Do you think they will work? What changes would you make to the list?

Make a note of your thoughts in your learning journal.

T2-1 M 2 Plan and Practise together

Supporting Learning Mathematics Through Questioning

Here are your planning tasks. You can use the activity plan template found in the Appendix.

1. In groups think of a lesson and a topic that you will teach in the coming week and find the specific materials you will use.

2. Think about what you want to change in your normal questioning practice.

3. Plan the questions you will use in your lesson to make this change happen.

4. Plan strategies you will use to get the whole class to participate in the discussion of the topic.

Please make sure that you have noted down everything you need to remember for your lesson in your activity plan.

T2-1 M 3 Teach

It is important for your professional learning that you actually teach the activity you have planned. Please make sure you have your own activity plan available when you teach. Also make sure that you note down any issues that arose during the lesson immediately after you have taught. In particular, remember to fill in your observations section of the activity plan immediately after you have taught.
Reflect together

Does Questioning Support Mathematics Learning?

Now that you have taught the lesson activity, reflect on how it went. If at all possible, do the reflection together with a colleague who has also tried the activity.

In your reflection, consider the following questions:

1. What strategies did you use to elicit information from your student teachers?
2. Did the questions you asked help to make your class interactive and thus support learning? How?
3. Why do you think it is important for a tutor/teacher to plan the questions to be used in class?
4. Is there any difference in the learning of the student teachers from the strategies you tried out in these lessons from what you normally do?

Remember to write down your thoughts in your learning journal. Also note down what you learned from this unit that was most effective in improving your teaching.

Extension Tasks

Taking your Mathematics Questioning Further

If you want to take your questioning techniques further, here are two extension tasks that you can use for further discussion, either during the PD session or with colleagues in your own time.

Extension task 1. The Initiation – Response – Feedback (IRF) exchange is a common feature of classrooms. Its role as a teaching and learning tool depends on the nature of the initiation question. Some questions allow the pupil to demonstrate knowledge while other questions relate more to understanding. The nature of a question is often defined by the first
keyword of the phrase. For example: “What is the . . . ” is often used to test knowledge. Conversely: “Explain why . . . ” requires some understanding.

Discuss with colleagues what advice can be given to student teachers about:

- phrasing questions in order to check whether pupils have acquired knowledge;
- phrasing questions in order to check whether pupils have acquired understanding.

**Extension task 2.** A student teacher tells you that she does not see the need for asking questions to find out if pupils have understood the lesson content because it will become evident whether they have understood or not when their work is marked.

Discuss with colleagues what arguments you could use to demonstrate to her why her approach is ill advised, and how she can make her teaching far more effective by encouraging two-way dialogue in her lessons.

**Extension task 3.** Flawed questions. Real life contexts which are familiar to pupils are often used in teaching. Putting something into a familiar context will make it easier to understand and more relevant to the learner. However, this approach is not without its pitfalls.

In an attempt to use real life situations teachers sometimes ask questions that cannot be answered by all pupils. For example a teacher might ask:

“There were nine apples on a tree. If some fell off, how many apples were left on the tree?”

The problem here is that pupils are not told exactly how many apples fell off so they cannot say how many remain on the tree. This means an algebraic answer can be found (9 - x; x is the number of apples that fell off the tree) but not an answer with a natural number (eg 3). Here is another example:

“Kofi has ten sweets. He gives each of his brothers and sisters a sweet. How many sweets does he have left?”

Pupils are not told how many brothers and sisters Kofi has so they cannot say how many sweets were given, and how many were left. An algebraic answer could be given (10 – n; n is the number of siblings).

In your group of tutors, come up with more of such questions that are flawed in some way and cannot be answered without using algebra. Make sure that some of those questions are relevant to the topic that you are teaching, and commit them to your learning journal. When you next teach, ask your student teachers those questions and ask them to provide answers. You can use the activity plan template found in the Appendix. Use the discussion that will inevitably result to discuss the pitfalls of asking pupils to answer questions that they cannot answer with the mathematical knowledge they have. Note your findings in your learning journal.

**Example**

Food Processing and Food Preservation

Here is an example of how tutor Adabor is teaching the food processing and food preservation unit.

At the start of the lesson, Mr Adabor has brought a few sample raw food items to the classroom. He asks his students to name a few of the fresh food items they use at home. He also asks them to list some of the food items on sale at the local market.

![Figure 4. Fresh foods](image)

He forms five groups of seven students to do the activities.
Mr Adabor: “List the names of the food stuffs on your table.”
Students: “Tomatoes, pepper, fish, cocoa, cassava, plantain, meat, mango, milk.”
Mr Adabor: “That’s great!” “How can you keep these food items for long (preserve)?”
He gives them several minutes to discuss their ideas before asking each group to list their responses on a sheet of paper for all to see. He asks group leaders to display the group responses on the wall. Mr Adabor and the students picked out the common ideas and terms they had used. For example, ‘peeling’, ‘washing’, ‘processing’, ‘smoking’, ‘freezing’, ‘salting’, ‘drying’ and ‘frying’. He asks them to write a sentence about what is done under each of the terms they have stated.
Mr Adabor asks:
“What do you have to do when you want to preserve food items?”
“Why do we have to process foods?”
“Do we preserve all foods in the same way?” Students give a chorus answer, “No!”
“OK, then, group the following raw foods under the following ways of preserving food: Canning, Freezing/Refrigerating, Drying, Salting, Bottling, Packing, and Smoking.”
Mr Adabor pastes a chart on the chalk board showing various food items and how they have been processed and preserved.
Fresh foods to processed foods
He then asks the students to compare their answers to what he has on the board. He visits each group as they do the activities to help students find answers to any challenges they have.
He asks the students the following questions one at the time. He also makes sure he gives the student teachers enough thinking time by checking on his watch and not saying anything further for at least 30 seconds.
“What happens if you leave fresh fruit in normal room temperature for some days?”
“What do you do if you want to stop food from becoming rotten?”
“Why do you use the refrigerator?”
“If you don’t have a refrigerator, what can you do to keep your food for a longer period?”
“Mention four ways of preserving food in your community.”
“Why do you think shops sell a lot of food in cans?”
Mr Adabor refers to the examples of processed foods that he has brought to the classroom. He clarifies the terms ‘food processing’ and ‘food preservation’. He also asks students to do exercises on food processing and preservation in their textbooks.

Tutor Discussion
Discuss with your colleagues and make a note of your thoughts in your learning journal about:

• What do you think about the questions Mr Adabor asked?
• Do you think giving longer ‘thinking time’ or ‘wait time’ is a good idea or not? Why? In what circumstances?

Plan and Practise together
Questioning to Support Learning in Science Lessons
Before using questioning for learning in your teaching, it is important that you try the questions out yourself with your tutor colleagues. Think of a lesson you must teach this week. Decide on a specific class and topic and use the activity plan found in the Appendix. Trying out the questions, and the ‘wait time’ you plan to use, will help you to determine their suitability for the lesson you are planning to teach.
T2-1 S 3 Teach

It is important for your professional learning that you actually teach the activity that you have planned. Please make sure that you have your activity plan to hand when you teach. Also make sure that you note down any issues that arose during the lesson immediately after you have taught. In particular, remember to fill in your observations section of the activity plan immediately after you have taught.

T2-1 S 4 Reflect together

How does Questioning Support Learning in a Science Lesson?

After the lesson, reflect on how it went. If possible, reflect with a tutor colleague who has also tried the activity. Consider the following questions:

- What effect did your questioning approach have on the learning?
- How well did you manage the questioning?
- Were you able to pause and give the student teachers time to think longer?
- How did your questioning affect the student teachers’ participation? How do you know this?
- Who participated, responded or had greater involvement in the lesson?
- Did the student teachers have opportunities to participate in the lesson?
- Did the less able student teachers have opportunities to participate in the lesson?
- What did they say or do that made you think they were more
interested?

Consider classroom situations where you can apply this kind of questioning to enhance student teachers’ learning. Also, encourage the student teachers to consider how they could use this kind of questioning to enhance student learning.

- What were the biggest challenges during the lesson?
- What did you learn about how to improve your questioning?

In your learning journal, comment on your efforts to improve your questioning technique. Did you pause after each question you asked? Did you wait long enough before speaking again? If student teachers have more time to think, do their responses improve?
Teaching Strategy 2
Open and Closed Questions

Have a look at the table below. It presents a number of different types of questions that we can ask.

<table>
<thead>
<tr>
<th>Question type</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>(a) Questions that are statements expressed as a question</td>
<td>Why are birds so clever they can weave nests with their beaks?</td>
</tr>
<tr>
<td>(b) Questions requiring simple factual answers</td>
<td>Where was the bird’s nest found?</td>
</tr>
<tr>
<td>(c) Questions requiring more complex answers</td>
<td>Why do some birds nest in trees and some on the ground?</td>
</tr>
<tr>
<td>(d) Questions that lead to enquiry by the student(s)</td>
<td>What is the nest made of?</td>
</tr>
<tr>
<td>(e) Philosophical questions</td>
<td>Why are birds made so that they can fly but other animals cannot?</td>
</tr>
</tbody>
</table>

A common way of categorising questions is as closed versus open questions:

- **Closed questions** are factual and focus on a correct response. Some examples are: Can you name the different parts of a plant? What are the five nutrients that must be present in a balanced diet? How many sides does a triangle have? What is the formula for calculating the perimeter of a square? How many planets are there in the solar system? Can you name two sources of renewable energy?

- **Open questions** have many answers that are less predictable. Some examples are: What could be the consequences of water contamination? How does a balanced diet help us? How could we use the flowers of plants? Can you suggest ways of preventing the spread of malaria in your community? The difference between two numbers is five, what are the numbers?

It is the context of a question that often determines whether it is closed or open. For example, in a lesson about water contamination a tutor asks the question “What could be the consequences of water contamination?” The question is a closed one if the question is intended to check student teachers’ recall of the three consequences they have been told about or are in their textbook. It is open-ended if the question is intended to stimulate discussion about the consequences of pollution and no specific answers are expected.

You can think of closed questions as questions that prompt students to follow a set procedure (such as a specific calculation routine). By contrast, open questions stimulate thinking and open-ended tasks, thus engaging students with problem-solving activities.
The importance of making the distinction between open and closed questions is the kind of learning it supports: closed questions work well for recall, open questions are often needed to make students think further and more deeply.

Another way of considering a question is as ‘surface’ or ‘deep’.

- **Surface questions** elicit one idea or some specific ideas. For example: *What is the difference between organic and inorganic fertilizers? What is the use of carbohydrates in a balanced diet? Which part of the sugar cane plant is eaten?*

- **Deep questions** elicit relations between ideas and extended ideas. For example: *What would happen if only inorganic fertilizers are used on growing plants? What connections do you see between the climate of a region and its vegetation?*

For example, consider this question: *What is the difference between a parallelogram and a rectangle?* The student will draw on their knowledge of the simple properties of these two quadrilaterals. It is a closed question. Now consider “*Can you give me reasons why \( \sqrt{2} \) does not have an exact value?*” In order to answer this last question the student must have some understanding of rational and irrational numbers. It is an open question. If the teacher is just expecting to hear “*because it’s an irrational number*” then the question is a closed one.

Again, the context determines whether the question is ‘surface’ or ‘deep’. While many closed questions are also surface questions, there is not always a direct match between open/closed and surface/deep. For instance, many closed (true/false) questions in mathematics are very deep. As a tutor, the skill is to ask the right question, at the right time, so that it supports learning.

So how can you decide whether your question is an open or a closed one, and whether it is surface or deep? Here is a set of prompts that can help you to evaluate the questions you want to ask your student teachers:

- Does this question have one correct answer?
- Is there more than one answer to this question?
- Are you using this question to get a student teacher to give you a particular answer?
- Could student teachers come up with the answer through their own thinking, or is it something that they either know or don’t know?
- Could the expected response to a question be challenged with a different but justifiable answer?
- Does the expected response fit with the learning activity (recall/problem solving) you want to happen?
**Tutor Discussion**

Try to come up with a few questions you would want to ask your student teachers and use this set of prompts to evaluate them.

![Figure 5. Students discuss open and closed questions](image)

• Identify strategies to help their students participate in lessons.  
• Use different types of questions and strategies to help pupils participate in lessons.  
• Develop a lesson based on these questions and strategies. |
Open and Closed Questions for English Language Learning

The passage below is used by a tutor to give an example of how to use ‘open and closed’ questions effectively. She begins by asking student teachers to work in pairs and write down all they know about the Ghanaian music scene. She then asks them to write down questions that they want to know more about regarding the Ghanaian music scene. Then, students read the passage below and find out if their questions have been answered.

Ghanaian Music: Past and Present

Ghanaians love to relax and dance to modern as well as traditional music. As far back as the 1920s Ghana had modern music which was called ‘Highlife’. Highlife started in the 1920s with bands like Jazz Kings, Cape Coast Sugar Babies and the Accra Orchestra. The original founder of this style of music and ‘King of Highlife’ was E.T. Mensah. He was born in Accra and he formed his first band in 1930. The most famous band he performed with was the ‘Tempos’ which he formed in 1948. They developed ‘Highlife’ based on African rhythms.

In the late 1990s in Ghana, a new generation of artists discovered Hiplife. The person who started this style is Reggie Rockstone, a Ghanaian musician who dabbled with hip-hop in the United States before finding his unique style. Hiplife basically was hiphop in the Ghanaian local dialect backed by elements of the traditional High-life. Some of the Hiplife artists include: Obrafour, Tinny and Ex-doe who further popularised the Hiplife music.

After they have read it the tutor asks:

- Did you find out anything new? What did you find out?
- Were your questions answered? Which ones?
- What new things did you learn from the article?
- Can you use it with your students? How would you use it?

After the ‘reading lesson’ she asks her student teachers to describe the questions used for the various stages and why they were used like this.
Plan and Practise together

Open and Closed Questions for English Language Learning

Before using open and closed questions in your teaching, it is important that you try the questions out yourself with your tutor colleagues. Use the activity plan found in the Appendix. Trying out the questions will help you to determine their suitability for the lesson you are planning to teach.

For example, in groups, think of a lesson and a specific topic that you will teach this week. What open and closed questions will you use? Write down 10 open questions and 10 closed questions in preparation.

Please make sure that you have noted down everything you need to remember for your lesson in your activity plan.

Teach

It is important for your professional learning that you actually teach the activity that you have planned. Please make sure that you have your activity plan to hand when you teach. Also make sure that you note down any issues that arose during the lesson immediately after you have taught. In particular, remember to fill in your observations section of the activity plan immediately after you have taught.

Reflect together

Open and Closed Questions for English Language Learning

After you have taught the lesson activity, reflect on how it went. If at all possible, do the reflection together with a colleague who has also tried the activity. In your reflection, consider the following questions:

1. Which questions worked the best in your lesson? Why do you think this was?

2. What strategies can you use to make the lesson more interactive? Why is this important for your pupils’ learning?

3. Which type of questions do you think can help the students say something meaningful?

4. What questions will you use to get your student teachers to come up with different ideas?

Make brief notes about your reflections in your learning journal.

T2-2 M 1 Example

Open and Closed Questions for Learning Mathematics

The importance of making the distinction between open and closed questions is the kind of learning it supports: closed questions work well for recall, open questions are often needed to make students think further and more deeply. In mathematics it is closed questions that tend to be asked, for example in textbooks, or by asking student teachers for the ‘correct’ answer to a calculation.

Tutor Saviour has noticed that in his teaching of mathematics he has tended to stick to asking closed questions. At the same time he notices his student teachers seem to find it hard to make connections between certain mathematical ideas. They also have difficulty applying the mathematics they know already in another context. From discussion with colleagues and researching open questioning on the internet, he compiles a short list of question prompts that would help him to construct more open and deep questions to make his student teachers think and understand mathematics. For his next lesson, which is on the real number system, he puts the general question prompts into a table, and writes how he could use them in the context of the lesson:
Question prompt | In the context of the real number system
---|---
This statement is always true. Can you change the statement so that it is sometimes/never true? | ‘The sum of a rational number and an irrational number is an irrational number’ is a statement that is always true. Can you change the statement so that it is sometimes or never true?
What do you think is the same and what is different? | What do you think is the same and what is different between 3.41414141....(3.41 recurring) and 3.010010001...?
Why do you think....? | Why do you think that the quotient of an irrational number divided by an irrational number can be a rational or irrational number?
This is the answer. What could have been the question? | 3√2 is the answer. What could have been the question?
Can you think of another example, and another, and another? | Can you think of another example of an irrational number greater than 1, and another, and another?

**Tutor Discussion**

Discuss with your colleagues the advantages and disadvantages of using these questions from the perspective of supporting student teachers in the learning of mathematics.

Think of three closed questions that you use in your teaching practice. Can you re-phrase them using the question prompts in the table so that they become more open and deeper questions?

Make a note of your thoughts in your learning journal.
Plan and Practise together

Open and Closed Questions for Mathematics Learning

Before using open and closed questions in your teaching, it is important that you try the questions out yourself with your tutor colleagues. Use the activity plan found in the Appendix. Trying out the questions will help you to determine their suitability for the lesson you are planning to teach.

With your colleagues, think of a lesson and a specific topic that you will teach this week. What open and closed questions will you use? Write down 10 open questions and 5 closed questions in preparation.

Please make sure that you have noted down everything you need to remember for your lesson in your activity plan.

Teach

It is important for your professional learning that you actually teach the activity you have planned. Please make sure you have your own activity plan available when you teach. Also make sure that you note down any issues that arose during the lesson immediately after you have taught. In particular, remember to fill in your observations section of the activity plan immediately after you have taught.

Reflect together

Using Open and Closed Questions for Mathematics Learning

Now that you have taught the lesson activity, reflect on how it went. If at all possible, do the reflection together with a colleague who has also tried the activity. Remember to make a note in your learning journal.

Extension Tasks

Practising Questions

If you want to take your questioning techniques further, here are two extension tasks that you can use for further discussion, either during the PD session or with colleagues in your own time.

Task 1: Asking closed and open questions.
Plan a task where you explain to the class that a group of student teachers carried out an activity in which they measured the masses of ten mangoes. They displayed the results as a bar graph.

Ask a student teacher to suggest either an open question or a closed question about the activity.

For example a closed question might be:

“What was the name of the device used to weigh the mangoes?”

An open question might be:

“What other ways are there to display the data?”

Repeat this for additional questions. For each question, discuss with the class whether it is closed or open in such a way that will allow student teachers to identify the two types of questions.

After teaching this lesson discuss with other tutors whether this was done successfully or not. Did student teachers have difficulty identifying the different types of questions? How did you overcome these difficulties?

**Task 2: Characteristics of closed and open questions.**

Write on the blackboard what you regard as three closed questions and three open questions on the topic you are currently teaching.

Now ask student teachers the answer the following about each of your questions.

• Does this question only have one correct answer?
• Is there more than one correct answer to this question?

Establish the differences between closed questions and open questions in a way that will allow students to identify them in the future.

**Task 3: Process skills and high-level thinking.** In recent years, many countries have moved away from a heavily knowledge-based curriculum where closed questions were mostly asked. The new curriculum seeks to give more prominence to process skills and higher-level thinking skills including application and analysis, where open questions are more commonly used. This has implications for the way in which pupils are taught.

In your tutor group, discuss what advice you can pass on to your student teachers about the importance of asking pupils different types of question in order to adopt a more process-focused approach?
Figure 6. Students enjoy a questioning activity.

T2-2 S 1 Example

Using Open and Closed Questions when Learning about Electrical Circuits

Here is a record of a learning session in a CoE class. Tutor Jocelyn is addressing one of the specific objectives of the DBE Integrated Science syllabus (Year 2, Semester 4, Unit 4).

To do this, Jocelyn has organised the resource materials needed to give the student teachers practical experience of working with the components of a simple electrical circuit. One group of students is using the resources, and the other students are observing. The pictures show the resources Jocelyn has arranged. She uses a sequence of questions to guide the group doing the practical work.

To the whole class: “Do you know how this torch works?”

To the whole class: “How do you switch a torch on?”
Figure 7. Simple torch

To the whole class: “Can you list the things that a torch must have, to make the bulb light?”

To the whole class: “If you do not have a battery, does the torch work?”

To the whole class: “If you do not have a bulb, does the torch work?”

To the whole class: “Why does the bulb light up?”

To the group: “Here is a torch, broken down into its separate parts.”
“What are the names of the bits?”

“Can you put the bits together, so that the bulb lights up?”

To the group: “So that we can play with the parts of the torch, we’ll use a dry cell holder for the two dry cells. The dry cell holder will have two dry cells, like this.”

“Why should you put the cells into a dry cell holder?”
To the group: “Experiment with the dry cell holder and the two dry cells. Examine the markings on the dry cell holder closely. Fit the dry cells into the dry cell holder. Try different ways.”

To the whole class: “What is the correct way to fit the dry cells into the holder?”

To the whole class: “Why do you think the holder has two metal connectors at one end?”

To the group: “Here is a collection of items. Use them to make the bulb light. Try different ways.”

![Simple circuit items](image)

Figure 10. Simple circuit items

What would happen if you connected one end of each of the two white wires to the dry cell holder terminals, and the other ends to themselves?

Why does the bulb not light up if you do this?

What would happen if you now touched an end of one of the white wires to one of the contacts of the bulb – like this?
Does the bulb light up?

What do you think you need to do to make the bulb light up?

Now, touch the other end of the white wire to the 2nd contact of the bulb – as in this picture. What happens?
Can you write a sentence to explain, in your own words, why the bulb lights up now?

In this picture, the person is not holding the end of the wire. The bulb is lighting up. Why?

Figure 13. Complete circuit

Are all the items in the picture above necessary to make the bulb light up?

Look closely at the picture of the ‘complete circuit’; then at the picture of the ‘incomplete circuit’. What is the important difference between the two situations?
**Tutor Discussion**

With your colleagues, look at (some of) the questions tutor Jocelyn used and discuss which of those were open and which were closed questions. You could use this table to help you:

<table>

Discuss the advantages and disadvantages of using these questions from the perspective of supporting student teachers in the learning of science.

Make a note of your thoughts in your learning journal.
Plan and Practisetgethether

Identifying Open and Closed Questions

Before attempting to use the examples with your student teachers, it is a good idea to complete some activities using this teaching strategy yourself. It would be even better if you plan them and try them out with your tutor colleagues. Use the activity plan found in the Appendix.

Planning task: Asking closed and open questions.

- Identify a topic you will be teaching this or next week.
- Plan your lesson using the activity plan and write down explicitly what questions you will be asking.
- Identify which of these questions are closed and which are open-ended.
- If you have any closed questions in your activity plan, try and turn half of these into open-ended questions
- Discuss with your tutor colleagues whether these are now the best questions you can ask in the lesson. Change accordingly.

Please make sure that you have noted down everything you need to remember for your lesson in your activity plan.

Teach

It is important for your professional learning that you actually teach the activity that you have planned. Please make sure that you have your activity plan to hand when you teach. Also make sure that you note down any issues that arose during the lesson immediately after you have taught. In particular, remember to fill in your observations section of the activity plan immediately after you have taught.

Reflect together

Challenges of Using More Open Questions

After the lesson, reflect on how it went. Consider the following questions:

- Was questioning like this the best way of assisting the student teachers to learn the scientific concept you were teaching?
- Did you notice a difference in participation and the quality of the answers between using closed or open ended questions?
- Did you modify the sequence of questions that you planned?
Write down your thoughts and any specific outcomes from your reflection in your learning journal. For example, what did you find to be the most challenging aspects of teaching this lesson? What difficulties did you experience when trying to generate more open questions?

Figure 14. Students practise questioning
Teaching Strategy 3
Avoiding Common Mistakes when Questioning

Good questioning skills can increase classroom participation and enhance conceptual understanding and achievement of your student teachers. At times questioning activities do not work as well as you may have hoped. There are some common reasons why this can happen, which can be remedied by making small changes to your practice.

One common issue is not giving the student teachers sufficient “thinking time”. Sometimes when a question is asked student teachers are expected to answer instantly. Answers to questions are not always obvious and student teachers need time to think. By increasing the “wait time” before responding to or re-phrasing a question you are giving the student teachers the opportunity and time to think of answers.

Research shows that waiting longer after posing a question causes an increase in:

- the length of the response;
- the number of responses;
- the frequency of student teachers’ own questions;
- the number of responses from less able student teachers;
- positive interactions between student teachers.

The way responses to questions are handled will determine the quality and participation of student teachers in responding to questions. Student teachers will feel encouraged to volunteer more answers when they feel they are in a safe learning environment. This is a classroom free from fear and ridicule, in which it is fine to ‘not know’, or to give a wrong or incomplete answer.

Below are some phrases (“talking points”) which describe some teaching practices when using questioning. Discuss these with a colleague and decide whether you agree or disagree with each approach. This will help you with identifying common mistakes when questioning and how to avoid these.

Tutors can support the learning of their student teachers by:

- asking many questions at once;
- giving student teachers enough time to think;
- asking a question and answering it themselves;
- asking a difficult question as soon as possible;
• always asking the same type of question;
• building on answers;
• asking a question in a threatening way;
• ignoring answers;
• correcting wrong answers.

Figure 16. Good questioning also requires good listening

Common Mistakes when Questioning

Here are some tips to avoid common questioning mistakes. If you were stuck above, these might help you get unstuck!

Give More Time for Student Teachers to Think

If you wait for a few seconds before expecting answers, the student teachers have time to think. This has a positive effect on student teachers’ achievement. You will be amazed at how much your student teachers know and how well you can help them progress their learning. They may well ask you follow-up questions so you should be prepared for this.
Respond Positively

The way incorrect responses are handled will determine whether student teachers continue to respond to the tutor’s questions. “That’s wrong”, “You are stupid” or other humiliation or punishment often stops student teachers volunteering any more answers out of fear of further embarrassment or ridicule.

Instead, if you can pick out parts of the answers that are correct and ask them in a supportive way to think a bit more about their answer, you may encourage more active participation. This helps your student teachers to learn from their mistakes in a way that negative behaviour towards them does not. The following phrase shows how you might handle an incorrect answer in a more supportive way:

“You have the correct verb but think about the tense. Is it present or past simple?”

Listen Carefully and Actively

The more positively you react to the answers given, the more student teachers will continue to think and try. There are many ways of ensuring that wrong answers and misconceptions are corrected. If one student teacher has the wrong idea, it is very likely that many more have it as well.

You must value all responses by listening carefully and asking the student teacher to explain further. If you ask for further explanation for all answers, right or wrong, student teachers will often correct any mistakes for themselves. You will develop a thinking classroom and you will really know what learning your student teachers have done and thus how to proceed. If wrong answers result in humiliation or punishment, your student teachers will stop trying for fear of further embarrassment or ridicule.

Improve the Quality of Responses

It is important that you try to adopt a sequence of questioning that does not always end with the right answer. Sometimes you should respond to a right answer with a follow-up question that extends their knowledge and provides student teachers with an opportunity to engage with you. You can do this by asking for:

- a how or a why question
- another way to answer
- a better word
- evidence to substantiate an answer
- integration of a related skill
- application of the same skill or logic in a new setting.
Helping student teachers to think more deeply about (and by so doing improve the quality of) their answer is a crucial part of your role. The following will help you to achieve this:

- **Prompting** requires appropriate hints to be given – ones that help student teachers develop and improve their answers. You might first choose to say what is right in the answer and then offer information, further questions and other clues. (“So what do you think happened to the girl when she entered the cave? So why do you think this adjective sounds better than that one?”)

- **Probing** is about trying to find out more, helping student teachers to clarify what they are trying to say to improve a disorganised answer or one that is only partly right. (“So, can you tell me more about the character of x as you have described her so well? “What other adverbs could you use to evoke the same atmosphere?”)

- **Refocusing** is about building on correct answers to link student teachers’ knowledge to the knowledge that they have previously learnt. This broadens their understanding. (“What you have said is correct, but how does it link with the rest of the story?”)

- **Sequencing** questions means asking questions in an order designed to extend thinking. Questions should lead student teachers to summarise, compare, explain or analyse. Prepare questions that stretch student teachers, but do not challenge them so far that they lose the meaning of the questions. (“Explain how you overcame your earlier problem. What difference did that make? What do you think you need to tackle next?”)

- **Listening** enables you to not just look for the answer you are expecting, but to alert you to unusual or innovative answers that you may not have expected. It also shows that you value the student teachers’ thinking and therefore they are more likely to give thoughtful responses. Such answers could highlight misconceptions that need correcting, or they may show a new approach that you had not considered. (“I hadn’t thought of that. Tell me more about why you think that way.”)

**Let Student Teachers Answer**

Remember, questioning is not about what the tutor knows, but about what the student teachers know. It is important to remember that you should never answer your own questions! After all, if the student teachers know you will give them the answers after a few seconds of silence, what is their incentive to answer in the first place?

<tr>
<td>T:</td>
<td>Okay Regina, have you ever been to Accra? Yes, right, good. You, (points to another student teacher) Have you ever seen snow?</td>
</tr>
<tr>
<td>S:</td>
<td>No</td>
</tr>
<tr>
<td>T:</td>
<td>Right, good. You (points to another student teacher), have you ever eaten Fufu? Have you ever drunk beer? Have you ever seen the sea? Yes, right. Good.</td>
</tr>
<tr>
<td>S:</td>
<td>Yes (at the same time as teacher says &quot;yes&quot;)</td>
</tr>
<tr>
<td>T:</td>
<td>What tense is this?</td>
</tr>
<tr>
<td>Ss:</td>
<td>Silence</td>
</tr>
<tr>
<td>T:</td>
<td>The present, the present . . .</td>
</tr>
<tr>
<td>Ss:</td>
<td>Perfect (whole class)</td>
</tr>
<tr>
<td>T:</td>
<td>Well done. Now write down 4 sentences using the present perfect with ‘ever’. Just as we practised now! Do you understand?</td>
</tr>
<tr>
<td>Ss:</td>
<td>YES! (whole class)</td>
</tr>
</tbody>
</table>
Now in pairs write down some of the mistakes the tutor made in their questioning. An example has been done for you:

<table>
<thead>
<tr>
<th>Common Mistakes in Questioning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asking a difficult question too early. E.g. What’s the most interesting thing you’ve ever done?</td>
</tr>
</tbody>
</table>

Now join with another pair and share your ideas. Are they the same or different? If you are stuck, have another look at the introduction to this teaching strategy for some additional tips.

**T2-3 E 2 Plan and Practise together**

**Common Mistakes when Questioning in English Language Learning**

Before attempting to use your lesson plans with your student teachers, it is a good idea to complete some activities using this teaching strategy yourself. It would be even better if you plan them and try them out with your tutor colleagues. Use the activity plan found in the Appendix.

In pairs or small groups **re-plan the lesson** above. To avoid such questioning mistakes remember that your student teachers are meant to be practising the ‘new’ language. Use your answers above to help you, that is, you should think of doing the opposite to avoid making the same mistakes in the questions you plan to ask.

Now, think of a lesson you must teach this week. Decide on a specific class and topic. Plan how you will avoid these common mistakes when questioning. Other things to consider will be: your cues, your context, the model you will provide. Using meaningful and appropriate cues, contexts and models are important strategies to help your student teachers be more involved.

Please make sure that you have noted down everything you need to remember for your lesson in your activity plan.
T2-3 E 3 Teach

It is important for your professional learning that you actually teach the activity that you have planned. Please make sure that you have your activity plan to hand when you teach. Also make sure that you note down any issues that arose during the lesson immediately after you have taught. In particular, remember to fill in your observations section of the activity plan immediately after you have taught.

T2-3 E 4 Reflect together

Common Mistakes when Questioning in English Language Learning

Now that you have taught the lesson activity, reflect on how it went. If at all possible, do the reflection together with a colleague who has also tried the activity. In your reflection, consider the following questions:

Thinking about the common mistakes in questioning – how many do you think you made in your own lesson? How can you help prevent making these mistakes in your questioning?

Look at the table below, and in pairs think back to what you did. Give specific examples of how you excelled!

<table>
<thead>
<tr>
<th>Common mistake</th>
<th>My Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asking too many questions at once</td>
<td></td>
</tr>
<tr>
<td>Asking a question and answering it yourself or giving half the answer and the whole class completes it</td>
<td></td>
</tr>
<tr>
<td>Asking a difficult question too early</td>
<td></td>
</tr>
<tr>
<td>Always asking the same type of question</td>
<td></td>
</tr>
<tr>
<td>Issue</td>
<td>Notes</td>
</tr>
<tr>
<td>----------------------------------------------------------------------</td>
<td>-------</td>
</tr>
<tr>
<td>Asking a question in a threatening way</td>
<td></td>
</tr>
<tr>
<td>Not using probing questions</td>
<td></td>
</tr>
<tr>
<td>Not giving student teachers enough time to think</td>
<td></td>
</tr>
<tr>
<td>Not checking understanding or asking the whole class, “Do you understand?”</td>
<td></td>
</tr>
<tr>
<td>Ignoring answers</td>
<td></td>
</tr>
<tr>
<td>Not correcting wrong answers</td>
<td></td>
</tr>
<tr>
<td>Failing to see the implications of answers</td>
<td></td>
</tr>
<tr>
<td>Failing to build on answers</td>
<td></td>
</tr>
</tbody>
</table>

Remember to make a note in your learning journal if you have one.
Teaching Strategy 3
Common Mistakes when Questioning in Mathematics Learning

<table>
<thead>
<tr>
<th>Theme</th>

<td>Learning Outcomes for Tutors</td>
<td>The tutor will become aware of mistakes that are frequently made when questioning.</td>
</tr>
</tbody>
</table>

**T2-3 M 1 Example**

**Avoiding Common Mistakes when Questioning in Mathematics Learning**

Mathematics tutors Mary and Ernest had been discussing the mistakes they thought they were making when using questioning in their lessons. They were very honest and open about their practice and came up with a long list of mistakes. To help themselves avoid making these in the future, they added their solutions. They planned to try these out, a couple at the time, in all their lessons in the next two weeks, and then to come together again to discuss. To remind themselves of their intentions they would put a printed copy of the list on their desk in the classrooms so they could refer to it and check how they were doing during the lessons.

This is the list tutor Mary compiled:
<table>
<thead>
<tr>
<th><strong>Common mistake</strong></th>
<th><strong>My Solution</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Asking too many questions at once</td>
<td>I will ask only one question at the time and give time to respond to that one question.</td>
</tr>
<tr>
<td>Asking a question and answering it yourself or giving half the answer and the whole class completes it</td>
<td>I will put my hands behind my back after I have asked a question and count on my fingers to 10, or even 20 before repeating or re-phrasing the question.</td>
</tr>
<tr>
<td>Asking a difficult question too early</td>
<td>I will first wait for at least 10 seconds (hands behind my back and counting in my fingers) before a) deciding that the question was too difficult; b) acknowledging to the student teachers that maybe this question was too difficult to be asked now and then c) re-phrase and start with an easier question.</td>
</tr>
<tr>
<td>Always asking the same type of question</td>
<td>This I will find difficult to avoid, I know that. So I will write up the questions I intend to ask in my activity plan. Then check whether these are not all of the same type. I will also refer to the plan during the lesson to make sure I stick to asking more varied types of questions.</td>
</tr>
<tr>
<td>Asking a question in a threatening way</td>
<td>I never mean to ask questions in a threatening way, but sometimes that happens. I will try and smile more, and not wag my finger.</td>
</tr>
<tr>
<td>Not using probing questions</td>
<td>I can address this in the same way than 'always asking the same type of question': plan for it and stick to the plan.</td>
</tr>
<tr>
<td>Not giving student teachers enough time to think</td>
<td>Again, I will put my hands behind my back after I have asked a question and count on my fingers to 10, or even 20 before repeating or re-phrasing the question.</td>
</tr>
<tr>
<td>Saying 'that is wrong' when a wrong answer is given, and moving onto another student teacher to give the 'correct' answer</td>
<td>Another one I will find hard to address because in maths the answer is often right or wrong. What I can try to do is: Plan to ask more questions that can have multiple answers; Instead of saying 'that is wrong', saying something like 'that is interesting'. What makes you think so (with a smile)? Asking the class whether they agree or disagree; Give the student teacher who said the wrong answer the chance to self-correct before asking someone else to answer.</td>
</tr>
<tr>
<td>Failing to build on answers</td>
<td>I will copy the list of suggestions that is in the introductory text of this teaching strategy, try them out and refer to the list during the lesson so I do not forget.</td>
</tr>
</tbody>
</table>
Summary – the main things I will change are:

| Plan my questions, write it up in an activity plan and refer to it during the lessons |
| Smile and not wag my finger |
| Give student teachers more thinking time by putting my hands behind my back after I have asked a question and counting on my fingers to 10, or even 20 before repeating or re-phrasing the question. Give student teachers the time and opportunity to self-correct. |

**Tutor Discussion**

Discuss this list with your tutor colleagues. Do the common mistakes tutors Mary and Ernest have identified resonate with your experiences? Do you have more mistakes to add? What would you write for your ‘solutions’?

Make a note of your thoughts in your learning journal.

**T2-3 M 2 Plan and Practise together**

**Avoiding Mistakes when Asking Questions in Mathematics**

Before attempting to use the examples with your student teachers, it is a good idea to complete some activities using this teaching strategy yourself. It would be even better if you plan them and try them out with your tutor colleagues. Use the activity plan found in the Appendix.

**Planning Task 1:** Improving questioning. Plan a strategy to guide you to improve the use of questions in your lessons this week. You could use a similar table to the one in the example, or come up with your own strategy. Discuss your ideas with your tutor colleagues.

Suggestions of what could be removed from lessons are:

- not giving student teachers sufficient time to respond;
- answering your own question.

Suggestions of what could be included in lessons are:

- asking more questions that test understanding;
- building on the responses to questions.

**Planning Task 2:** In pairs or small groups, think of a lesson you are teaching this week. Decide on a specific class and topic. Think about how you will avoid these common mistakes when questioning. As you are developing your activity plan, make sure that you write down the questions you will ask, adding reminders to avoid the common questioning mistakes we have discussed.
Please make sure that you have noted down everything you need to remember for your lesson in your activity plan and take the plan with you into the lesson so you can refer to it while teaching.

**T2-3 M 3 Teach**

It is important for your professional learning that you actually teach the activity you have planned. Please make sure you have your own activity plan available when you teach. Also make sure that you note down any issues that arose during the lesson immediately after you have taught. In particular, remember to fill in your observations section of the activity plan immediately after you have taught.

**T2-3 M 4 Reflect together**

**Common Mistakes when Questioning in Mathematics Learning**

Now that you have taught the lesson activity, reflect on how it went. When you discussed questioning, how readily did your tutor colleagues accept what you suggested were common mistakes? Was there total agreement about each of the issues that was raised or was there disagreement over some of the points?

When you were teaching, did your solutions to avoid common mistakes work? How come? Do you have to make amendments to your solutions?

Remember to write down any specific outcomes from your reflection in your learning journal. Was the importance of effective questioning generally appreciated? Also note down what you learned from this unit that was most effective in improving your teaching.

**T2-3 M 5 Extension Task**

**Questioning Practice**

If you want to take your questioning techniques further, here are two extension tasks that you can use for further discussion, either during the P D session or with colleagues in your own time.

**Extension planning task: Effective and ineffective practice.** Look for video clips (e.g. on Youtube) in which a teacher is taking a lesson in mathematics, or another subject if no suitable examples from mathematics can be found.
Choose one video clip that you think is an example of either effective practice or ineffective practice.

Share your video clips with your tutor colleagues. Observe each video clip and consider how the teacher created the classroom environment for the pupils to ask questions. In particular, observe how the teacher managed the responses of the pupils to either support their pupils’ learning or discourage them from asking further questions. Select one example of effective practice and one example of ineffective practice from the clips observed for future reference.

What lessons did you and your tutor colleagues learn from the teachers in the videos they watched? Were you able to identify examples of good practice and of poor practice? Did you identify instances where the questioning could have been handled better? Discuss your observations with your tutor colleagues.

**Extension reflection task: Learner-centred approach.** Moving towards a more learner-centred approach requires changes to traditional classroom roles. Learners must take on more responsibility for their own learning while the role of the teacher moves from being the sole source of information to one of an organiser and adviser who directs the efforts of learners.

With your tutor colleagues discuss whether a move towards a more learner-centred approach in the classroom increases or decreases the importance of two-way dialogue between teacher and learners.
Teaching Strategy 3
Avoiding Common Mistakes when Questioning in Science Lessons

<td>Avoid common mistakes when framing questions to assist student teachers to grasp concepts.</td>
</tr>
</tbody>
</table>

**T2-3 S1 Example**

**Avoiding Common Questioning Mistakes when Learning about Osmosis**

Samson, a science tutor, taught a lesson using investigation to learn about osmosis. He set up the investigation as shown in these pictures:

![Figure 17. Osmosis experiment](image-url)
He decided to use both yam and cassava. He wanted to show the student teachers which tissue allowed osmosis to occur more rapidly.

Samson and the student teachers decided to put a teaspoonful of salt into the cavity of the piece of yam and the piece of cassava. Then they dropped a little water onto the salt to dampen it. This resulted in the cavity having a very concentrated salt solution.

Samson’s next science revision period with the class was the following day. He brought the completed experiment into class. This picture shows the water level marks on both the yam and cassava.

![Figure 18. Osmosis marks on yam and cassava](image)

Here are some questions that Samson asked about the investigation during the class discussion:

- Can you say how the water appears to have moved from the basin into the cavities?
- What is this investigation trying to show?
- Did the volume of water in the cavities of the yam and cassava rise?
- What happened to the levels?
- Can you say how the water appears to have moved from the basin into the cavities?
- Where else can the water from the basin go during the investigation period?
- Is there any way that the salt solution in the cavity might be lost?
• What would happen if there is salt in the cavities in the yam and cassava and also in the dish?
• What do you think might be the result if you had used boiled yam and cassava?
• Can you describe another experiment you can do to try this with boiled yam?

Discuss these Questions with your Tutor Colleagues

Identify Samson’s strong questions.

Identify the questions that you think are weak.

In the introduction the following four common questioning problems were mentioned:

• Questions are repetitive;
• Teacher doesn’t give enough ‘thinking’ time (‘wait’ time);
• There are too many questions of the same type;
• Questions follow a set pattern (e.g. initiation-response-feedback).

For each weak question you identify, try to say which of the four problems it has?

Make a note of your thoughts in your learning journal.

Plan and Practise together

Avoiding Common Questioning Mistakes when Teaching Science

Before attempting to use the examples with your student teachers, it is a good idea to complete some activities using this teaching strategy yourself. It would be even better if you plan them and try them out on your tutor colleagues. Use the activity plan found in the appendix.

Planning task: Improving questioning. Plan and prepare your own questions for the lesson you are planning to take with your student teachers. Try to avoid the problems you identified in Samson’s questions.

Please make sure that you have noted down everything you need to remember for your lesson in your activity plan.
T2-3 S 3 Teach

It is important for your professional learning that you actually teach the activity that you have planned. Please make sure that you have your activity plan to hand when you teach. Also make sure that you note down any issues that arose during the lesson immediately after you have taught. In particular, remember to fill in your observations section of the activity plan immediately after you have taught.

T2-3 S 4 Reflect together

Avoiding Common Questioning Mistakes when Teaching Science

After the lesson, reflect with your colleague tutors how it went. Use these questions to prompt your reflection:

- What effect did your questioning have on your student teachers’ learning? Did you manage to avoid Samson’s mistakes?
- Were you able to pause and let the student teachers think longer about a question?
- How did this affect the student teachers’ participation? Did some respond more frequently? Did some have greater involvement in the lesson?
- Did your questions focus equally on those student teachers who are less able as well as those who are more able?
- Did female and male students participating equally?
- Did you repeat questions?

Comment in your learning journal on the questioning mistakes.
Teaching Strategy 4
Using Questions to Promote Thinking

Questioning is a very powerful teaching technique that can used in any classroom to address a wide range of purposes and objectives. Here are some of the many reasons why a tutor you could use questioning:

- to interest, engage and challenge student teachers;
- to assess prior knowledge and understanding;
- to assess learning and understanding in the lesson
- to stimulate recall
- to focus thinking on specific aspects;
- to make student teachers think more deeply

Developing questioning skills requires you to think about what the purpose of your questioning is, and then to think about what questions are most effective to achieve that purpose. This teaching strategy “Using questions to promote thinking” focusses on asking questions with the purpose of developing the thinking skills of your student teachers.

Questions to Address Different Types of Thinking

Thinking is often categorised as ‘lower order’ or ‘higher order’. Bloom’s taxonomy of cognitive skills, developed by Bloom and colleagues in 1956, has been used a lot in the last fifty years to describe ‘thinking levels’. Although it has been criticised for over-simplifying human thinking, using Bloom’s taxonomy can be a helpful tool to develop different questions to ask your student teachers in order to trigger different kinds of thinking. The figure below shows Blooms’ Taxonomy, a hierarchy of thinking skills with suggestions of questions to ask.

Tutor Discussion

Discuss these with a colleague and decide for each question whether you think they would trigger the kind of thinking skill that is intended. Would the question work in your subject area or how would you modify it? This will help you to develop a good bank of questions to ask your student teachers to help them think.
**Higher order thinking skills**

**Creating**
What alternative would you suggest for ...?
What changes would you make to amend ...?
Predict the outcome if ...
What could you invent ...
How would you compile the facts for ...
If you had access to all resources how would you deal with ...
Compose a song about ...
Write a story/poem/news article etc. about ...
Design a ... to ...

**Evaluating**
What criteria could you use to assess ...
What data was used to evaluate ...
What choice would you have made ...
What is the most important ...
How could you verify ...
Is there a better solution to ...
What do you think about ...
Do you think this is a bad or a good thing?

**Analysing**
How can you classify ... according to ...
How can you compare the different parts ...
What explanation do you have for ...
Discuss the pros and cons of ...
What is the analysis of ...
How is ... similar to ...

**Applying**
How would you develop ... to present ...
What would happen if ...
How would you present ...
How would you change ...
Why does ... work?
Can you develop a set of instructions about ...
What factors would you change if ...

**Understanding**
How would you clarify the meaning ...
How would you differentiate between ...
What did you observe ...
How would you identify ...
What would happen if ...
Can you give an example of ...

**Remembering**
What do you remember about ...
How would you define ...
How would you recognise ...
What would you choose ...
Describe what happens when ...
How is ...
Which one ...
Why did ...

</thead>
</table>
| Links to Syllabus         | Year 1 Semester 1: use of productive and receptive skills in student teachers’ communicative activities; introduction to elements of communication – skills necessary for effective communication.  
Year 2 Semester 2: develop and sharpen students’ skills and competencies in the teaching of English at the basic level – develop the 4 language skills: listening, speaking, reading and writing; presenting skills lessons.  
Year 2 Semester 1 (Elective Literature): identifying and describing poetry, responding and analysing poetry.  
Year 3 Semester 1: develop further studies in grammar, comprehension and writing – being able to develop argumentative essays and debate; debating points raised by other side; features of debate.  
ECE 122: developing language and literacy; oral language development including: songs, rhymes, poems & verse; conversation; storytelling. Reading readiness and methodology of reading |
| Learning Outcomes for Tutors | By the end of the session tutors will be able to:  
• link their questioning to lower and higher order thinking skills  
• identify activities in terms of lower and higher order thinking skills and plan questions accordingly  
• plan their questions to promote thinking so as to develop analytical and discovery skills in their students. |

Example

Using Questions to Promote Thinking for English Language Learning

Different Learning Activities will require your student teachers to use and develop different thinking skills, depending on the stage of their learning and the stage of the lesson. These thinking skills move from lower to higher order thinking skills, often referred to as Higher Order Thinking Skills (HOTS) and Lower Order Thinking Skills (LOTS).
Look at the following English Language activities that you can use in your classrooms. In pairs decide and discuss what level of thinking skills is required for each activity (see Plan and Practise Together, Task 1).

**Example 1: Mapped Dialogue**

A mapped dialogue is a prompt for student teachers to conduct their own questioning dialogue. Look at the map below, and the dialogue that follows. You can easily create a dialogue map on your own whiteboard to practise any type of question or subject area you have to teach.

---

**Key:** T=tutor; Ss=student teachers

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ACCRA</strong></td>
<td><strong>ABURI</strong></td>
</tr>
<tr>
<td>...Aburi?</td>
<td>...cool!</td>
</tr>
<tr>
<td>...hot!</td>

</tr>
<tr>
<td>...Accra!</td>
<td>...hot...</td>
</tr>
</tbody>
</table>

---

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>T</strong></td>
<td>Where is she?</td>
</tr>
<tr>
<td><strong>Ss</strong></td>
<td>In Accra</td>
</tr>
<tr>
<td><strong>T</strong></td>
<td>Where's he?</td>
</tr>
<tr>
<td><strong>Ss</strong></td>
<td>In Aburi</td>
</tr>
<tr>
<td><strong>T</strong></td>
<td>She asks a question about the weather in Aburi. What does she ask?</td>
</tr>
<tr>
<td><strong>Ss</strong></td>
<td>What's the weather like in Aburi?</td>
</tr>
</tbody>
</table>
What does he reply?
Ss It’s cool!
T Now he asks about the weather in Accra. What does he ask?
Ss What’s the weather like in Accra?
T And what does she reply?
Ss It’s hot!
T Good. Practise that with your partner.
T What’s next? Make his next question
Ss What kind of weather do you like?
T And her reply?
Ss I like cool weather
T And where is it cool, in Accra or Aburi?
Ss In Aburi.
T So what does she say?
Ss Come to Aburi!
T Great, now practise the whole conversation with your partner

Example 2: What and Where?

Put any number of new vocabulary words all over the board, not in a list.

Call 2 student teachers or 2 teams to the front of the class.

Ask them to stand an equal distance from the blackboard.

Call out in a loud voice a question with one of the new words.

The 2 student teachers must run forward and slap the word on the board.

The one who slaps the correct word first is the winner.

If you are playing in teams, the winning team gets a mark.

Then ask 2 more student teachers to come forward etc.
Example 3: Role-Play

Work in pairs to make a conversation between an interviewer and Kofi Annan, using the following points to make questions and answers:

- Born
- Married
- Children
- Career
- Number of books (written)
- Type of books
- Name of books
- Plans for future

Plan and Practise together

Using Questions to Promote Thinking

Before attempting to use the examples with your student teachers, it is a good idea to complete some activities using this teaching strategy yourself. It would be even better if you plan them and try them out with your tutor colleagues. Use the activity plan found in the Appendix.

Task 1. Categorise examples 1, 2, and 3 above using the table below. What ‘thinking skill’ is each activity practising? Consider the level of ‘thinking effort’ required for the activity. Do you think it is a lower or higher order thinking skill? In some examples there may be more than one ‘thinking skill’.
<table>
<thead>
<tr>
<th>Activity</th>
<th>Thinking skills practised (developed)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example 1: Mapped Dialogue</td>
<td></td>
</tr>
<tr>
<td>Example 2: What and Where</td>
<td></td>
</tr>
<tr>
<td>Example 3: Role-Play</td>
<td></td>
</tr>
</tbody>
</table>

**Thinking skills list:**

- understanding
- remembering
- recalling
- creating
- evaluating
- analysing
- applying
Task 2. Now work in pairs with your tutor colleagues. Write the ‘thinking skills’ from above into the table below. The first one ‘remembering/recalling’ has been done for you. Then match types of questions that can help your pupils develop these skills. See the first example in the table. Now do the other questions which are in the box below.

Task 3. Join up with another pair and share ideas.

<table>
<thead>
<tr>
<th>Thinking skill</th>
<th>Questions we can use to help develop the skill</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remembering, recalling</td>
<td>Think of our last lesson. What do you remember about . . . ?</td>
<td>Tell me 3 adjectives that we learnt yesterday to do with the weather.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Types of questions we can use to help develop ‘thinking skills’:

• Can you give me an example of ...?
• Think of our last lesson. What do you remember about . . . ?
• What is the analysis of . . . ?
• How might you use . . . ?
• What is the most important..?
• Compose a song/poem on the topic . .

Task 4. In groups, think about which classes you will teach this week. Plan how you will promote higher order thinking skills in one of your lessons. Make specific reference to a piece of syllabus material or subject.

Please make sure that you have noted down everything you need to remember for your lesson in your activity plan.

T2-4 E 3 Teach

It is important for your professional learning that you actually teach the activity that you have planned. Please make sure that you have your own activity plan to hand when you teach. Also make sure that you note down any issues that arose during the lesson immediately after you have taught. In particular, remember to fill in your observations section of the activity plan immediately after you have taught.
Reflect together

Using Questions to Promote Thinking for English Language Learning

Now that you have taught the lesson activity, reflect on how it went. If at all possible, do the reflection together with a colleague who has also tried the activity. In your reflection, consider the following questions:

- How did your lesson activity proceed? Were you able to practise using different types of questions?
- Which of the ‘thinking skills’ above are ‘lower order thinking skills’ (LOTS) and which are ‘higher order thinking skills’ (HOTS)? Write them in order using the box below:

<table>
<thead>
<tr>
<th>HIGHER ORDER THINKING SKILL</th>
</tr>
</thead>
<tbody>
<tr>
<td>REMEMBERING / RECALLING</td>
</tr>
</tbody>
</table>

- Why do we need to use both LOTS and HOTS in teaching and learning?
- What are the implications for our questioning techniques as tutors and teachers?

Write down your thoughts and any specific outcomes from your reflection in your learning journal.
Teaching Strategy 4

Using Questions to Promote Thinking in Mathematics Learning

<table>
<thead>
<tr>
<th>Theme</th>
<th>Questioning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link to Syllabus</td>
<td>DBE: course code PFC 222, Year 2, Semester 2, Unit 7 – Teaching geometric shapes and constructions</td>
</tr>
<tr>
<td>Learning Outcomes for Tutors</td>
<td>The tutor will learn how to use questions to promote thinking.</td>
</tr>
</tbody>
</table>

T2-4 M 1 Example

Using Questions to Identify Similarities of Solid Shapes

A group of student teachers were provided with the following solid shapes:

- Cube
- Cuboid
- Hexagonal Prism
- Triangular-based Pyramid
- Square-based Pyramid
- Triangular Prism

They were told that there is a property shared by all of the shapes. Their challenge was to find out what that property is by asking questions.

They started by asking simple questions like:

“Do the shapes all have the same number of faces?” - “No, that isn’t it.”
“Do all the shapes have the same number of edges?” - “No, that isn’t it either.”

Eventually, the teacher suggests they ask themselves questions not just about faces, vertices or edges, but the relationship between them.
Eventually the student teachers were able to deduce Euler’s formula:

\[ \text{Number of faces} + \text{number of vertices} = \text{Number of edges} + 2 \]

**Tutor Discussion**
Discuss with your colleague tutors the advantages and disadvantages of asking student teachers to come up with their own questions to help them in their learning.

- Would you do it in the same way? Would you make any changes in your approach?
- Make a note of your thoughts in your learning journal.

**Plan and Practise together**

**Preparing Suitable Questions**

Before attempting to use the examples with your student teachers, it is a good idea to complete some activities using this teaching strategy yourself. It would be even better if you plan them and try them out with your tutor colleagues. Use the activity plan found in the Appendix.

The following is a useful task that can help you prepare to use questions to promote thought. There are further ideas in the Extension Tasks section below.

**Planning task.** Posing questions that stimulate thought is not easy, so as a tutor it is important to prepare questions ahead of time for an effective lesson. Below is a list of types of questions that a tutor could ask during a lesson:

- Questions to find out what a student teacher knows
- Questions that provide the student teacher with guidance or a hint
- Questions to help a student teacher explain their reasoning
- Questions that require a student teacher to defend their ideas
- Questions to help a student teacher consider alternative strategies
- Questions that help the student teacher to reflect.

[Source: http://nzmaths.co.nz/sites/default/files/images/ALiM_Resource06.pdf]

Plan a lesson in which your student teachers will work in groups. Assign each group a mathematical topic that you will be teaching this or next week. With your tutor colleagues, generate one question from each of the above categories within the context of your topic. Share, discuss and refine your questions.

Please make sure that you have noted down everything you need to remember for your lesson in your activity plan.
T2-4 M 3 Teach

It is important for your professional learning that you actually teach the activity you have planned. Please make sure you have your own activity plan available when you teach. Also make sure that you note down any issues that arose during the lesson immediately after you have taught. In particular, remember to fill in your observations section of the activity plan immediately after you have taught.

T2-4 M 4 Reflect together

How do We Devise Suitable Questions?

Now that you have taught the lesson activity, reflect on how it went. If at all possible, do the reflection together with a colleague who has also tried the activity. In your reflection, consider the following:

How easy did you and your tutor colleagues find it to create the different types of questions identified in the planning task? Did some categories of questions generate more problems than others? Discuss with your tutor colleagues which types of questions you found most difficult to formulate and what helped to overcome the difficulties.

Write down your thoughts and any specific outcomes from your reflection in your learning journal. What are the most challenging aspects of provoking thinking through questioning? Also note down what you have learnt from this unit that was most effective in improving your teacher education programmes.

T2-4 M 5 Extension Tasks

Euler’s Formula and Fractions

If you want to take your questioning techniques further, here are two extension tasks that you can use for further discussion, either during the PD session or with colleagues in your own time.

Extension planning task 1. Based on the model example in which student teachers apply their knowledge of shape and space to derive Euler’s formula, plan a lesson which extends a concept beyond that which is normally taught. For example, with Euler’s formula this could be the plan for a lesson where you explore the formula for solid shapes which have one or more curved edges e.g. a cylinder or a cone.
By asking suitable questions, student teachers should be able to determine whether Euler’s rule is valid for all solid shapes or only those that do not have curved edges.

**Extension planning task 2.** In the preamble to the 2012 Primary and Junior High School syllabuses, six profile dimensions were identified: knowledge, understanding, application, analysis, synthesis and evaluation.

The table below shows questions that could be asked about fractions and solid shapes in the different categories:

<table>
<thead>
<tr>
<th>Fractions</th>
<th>Shapes</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Knowledge</strong></td>
<td><strong>Knowledge</strong></td>
</tr>
<tr>
<td>List the fractions you know and can show.</td>
<td>List the attributes of your shape.</td>
</tr>
<tr>
<td><strong>Understanding</strong></td>
<td><strong>Understanding</strong></td>
</tr>
<tr>
<td>Find items that you can use to show the fractions.</td>
<td>Find items that you can use to show the shape.</td>
</tr>
<tr>
<td><strong>Application</strong></td>
<td><strong>Application</strong></td>
</tr>
<tr>
<td>Draw a diagram which shows these fractions or take photographs of the fractions.</td>
<td>Construct basic shapes using a ruler and measurement.</td>
</tr>
<tr>
<td><strong>Analysis</strong></td>
<td><strong>Analysis</strong></td>
</tr>
<tr>
<td>Design a survey to find out which fractions are easy and which are hard. Produce a graph to show your results.</td>
<td>Identify where the shape is found in the classroom and school.</td>
</tr>
<tr>
<td><strong>Synthesis</strong></td>
<td><strong>Synthesis</strong></td>
</tr>
<tr>
<td>Create a PowerPoint presentation fractions game for others to play.</td>
<td>Create an item that includes all or part of your shape. Draw and label your design.</td>
</tr>
<tr>
<td><strong>Evaluation</strong></td>
<td><strong>Evaluation</strong></td>
</tr>
<tr>
<td>Choose a diagram or picture to represent the most difficult fractions to use in a game.</td>
<td>Tell why your shape is used in the places it is.</td>
</tr>
</tbody>
</table>

Learning to recognise the categories of questions listed in the table takes practice. With your tutor colleagues relate examples of each of the categories above that you have asked in one of your lessons, or that they have been asked by other tutors.

**Extension reflection task 1: Expected answers.** Tutors are sometimes frustrated when student teachers fail to answer questions in sufficient detail or sufficient depth. However the problem sometimes lies with the tutor because they have not asked the question that would give the expected answer.
Reflect with tutor colleagues on how best to advise about wording questions in order to obtain the desired response. For example, when devising a question is it sometimes wise to start with the required answer and then word the question in a way that will solicit this?

**Extension reflection task 2: Visual stimuli.** While the tutor may often use questions alone to provoke thought, sometimes a visual stimulus will make the process more effective.

![Dodecahedron](image)

**Figure 21. Dodecahedron**

For example, the solid shape above is a dodecahedron. It has straight edges but the whole solid has a curved shape. Asking the ‘Should we expect a dodecahedron to follow Euler’s formula or not?’ while showing the student teachers the picture, can help them in their learning and understanding.

**Discuss this with colleagues.** Think of other examples you can pass on to your student teachers where a visual stimulus of some kind can be usefully used to support a thought-provoking question.

T2-4 S 1 Example

Questions to Promote Thinking about Forces

Matilda is preparing to do a science lesson on forces. The objective is that student teachers will be able to explain the term ‘force’. The DBE syllabus refers to ‘Definition and types of forces, their effects and application’.

Matilda organises the practical activities listed in this table.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Force used</th>
<th>Direction</th>
<th>Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lifting a big stone</td>
<td>Pull</td>
<td>Upwards</td>
<td>large</td>
</tr>
<tr>
<td>Lifting a small stone</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Hammering a nail into wood</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Screwing a screw into wood</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Stirring water</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Separating two magnets</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Blowing up a balloon</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Squeezing a sponge</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
She organises the student teachers into mixed-ability groups to work on the tasks.

The first activity asks student teachers to do a series of physical tasks. They then have to decide which kind of force is at play (push, pull, turn or twist). After the student teachers have done the tasks, Freda questions them to check for understanding. During the discussion part of the session, she asks this sequence of questions:

- Did each group identify the types of force correctly?
- What is the difference between the force you applied when lifting the big stone and lifting the small stone?
- In what direction did you apply the force to lift the stones?
- Why is the upward force you applied on the big stone greater than that for the small stone?
- What did you have to do to hammer the nail into the piece of wood?
- What kind of force is this? Why is it possible for the nail to push through the wood?
- Do you think you could hammer the nail through a piece of stone? Why not?
- Did you hammer with the same force each time you struck the nail into the wood?
- What do you think would happen if we found a strong man to hammer the nail into the wood?
- Compare the size of the force you used to push the screw into the wood with the size of the force you used to hammer the nail into the wood.
- What tool did you use to push the screw in?
- What comment would you make about the force you used to screw the screw into the piece of wood?
- Why is the force needed to screw something different from the force needed to hammer something?
- Examine the screw and the nail. Can you explain how they are different?
- The screw has a spiral track on it. Can you explain why this helps you to push the screw into the wood?
- When you stirred the water, did you use a push or a pull force?
- What did you observe as you stirred the water faster?
• What happened when you suddenly stopped stirring the water?
• What would happen if you stirred the water with a straw instead of a spoon?
• Which ends of the two bar magnets pull each other together?
• Which ends of the two bar magnets push each other apart?
• How do you explain this magnetic ‘push’ and ‘pull’?
• Where does the force to blow up the balloon come from?
• How is this force different from using a pump to inflate a bicycle tube?
• Can you describe in one sentence what happens as you blow into the balloon?
• How are stretching the rubber band and blowing up the balloon similar?
• In what way are those two forces different?
• Where is the water stored in the ‘full’ sponge?
• Why does squeezing the sponge push the water out?
• Can you name an everyday activity where you use the same ‘squeezing’ force?

Matilda ends the series of questions by writing a summary of the experiences on the blackboard.

With your tutor colleagues, go through the list of questions that Matilda used. Discuss how to answer each of Freda’s questions. Discuss your opinions of Matilda’s efforts to get the student teachers thinking.

**Plan and Practise together**

**Generating ‘Thinking’ in Science**

Before attempting to use the examples with your student teachers, it is a good idea to complete some activities using this teaching strategy yourself. It would be even better if you plan them and try them out with your tutor colleagues. Use the activity plan found in the Appendix.

**Asking ‘thinking’ questions:**

• Identify a topic you will be teaching this or next week.
• Plan your lesson using the activity plan and write down explicitly what thinking questions you will be asking. Consider what questions to ask, so that your students would be helped to think about the concepts. Think of the questions that Matilda asked.
• Try to create other questions which might follow on to make the student teachers think more deeply. For example, for the question Matilda asked “How is this force different from using a pump to inflate a bicycle tube?” there might be a good follow-on question “What kind of force is pushing back against you when you pump up the inner tube of the bicycle?”, and “Why does the work of pumping become harder and harder as the tube inflates?”

• Identify which of these questions you are sure will trigger your student teachers to think, and which you are unsure about.

• Discuss with your tutor colleagues whether these are now the best thinking questions you can ask in the lesson. Pay particular attention to the questions you are not too sure about. Try them out and then refine the questions.

Please make sure that you have noted down everything you need to remember for your lesson in your activity plan.

T2-4 S 3 Teach

It is important for your professional learning that you actually teach the activity that you have planned. Please make sure that you have your activity plan to hand when you teach. Also make sure that you note down any issues that arose during the lesson immediately after you have taught. In particular, remember to fill in your observations section of the activity plan immediately after you have taught.

T2-4 S 4 Reflect together

Analysing ‘Thinking’ Questions

Now that you have taught the lesson activity, reflect on how it went. If at all possible, do the reflection together with a colleague who has also tried the activity.

The figure below shows Bloom’s Taxonomy, a hierarchy of thinking skills. The six levels of the hierarchy move from ‘lower order’ thinking skills to ‘higher order’ thinking skills.
Consider each of the questions you used during your lesson. Ensure that you have all the resources for the activities ready for use during the discussion about the questions. For each question, try to identify which of the six levels it might be. As you reach a conclusion for each one, label the question with Remembering, Understanding, Applying, Analysing, Evaluating, or Creating.

Give opinions on the questions:

- What proportion of the questions were Remembering or Understanding?
- What proportion were at the higher levels – Applying, Analysing, Evaluating, or Creating?
- How many questions do you consider to be at the Creating level?

As discussion points come up, repeat some of the activities. With your tutor colleagues you will raise issues that did not come up during the lesson you took with student teachers.

In your learning journal, record the results of your analysis of the questions. Give the data on the proportion of questions at the various levels of the hierarchy. This information is an indication of how the questioning promotes thinking skills.
Figure 23. Students practise asking questions and discussion
Teaching Strategy 5
Using Questions to Investigate Misconceptions

Student teachers come to the classroom with pre-existing knowledge and skills. When a tutor introduces a new topic or concept student teachers may well have some prior knowledge about it. At times, this knowledge could be incomplete, partially misinformed or simply wrong. Erroneous understanding of something is called a misconception and is a normal part of the learning process. Ideas and understanding are formed from everyday experiences. Many correct ideas arise from previously incomplete understanding – this is even true for some groundbreaking ideas in science. It is a fact of life that not all ideas are based on a fully correct explanation of natural phenomena, and indeed, some concepts and ideas are very difficult to grasp. Research even tells us that this is the case: many people have ideas about our natural world that are misconceptions.

Student teachers are unaware that some of their ideas are misconceptions. Such misconceptions make it very difficult to process new information about the concept. Misconceptions thus need to be overcome, and “re-learning” needs to take place, including replacing and reorganising exiting ideas.

How do you do this? Often, reading pieces of text, listening to lectures, or even learning by discovery, are not successful at challenging and changing misconceptions. Often what is needed is the support of a tutor, who can make student teachers aware of their misconceptions. Constructivist models talk about the role cognitive conflict in challenging misconceptions. Cognitive conflict is the mental discomfort a person feels when she faces new information that contradicts prior beliefs and ideas. A person usually tries to reduce this discomfort, for example by re-organising their ideas.

Questions are a great way to challenge: Good questions encourage learners to engage with the way of thinking about something. Here are some strategies in which to use questioning to assess and address misconceptions:

• Engage in argument and debate to strengthen newly-acquired correct knowledge;
• Find hands-on ways of presenting the new concepts;
• Use analogies to make a bridge from the previous understanding to the new one;
• Use models to help with reasoning;
• Use case studies;
• Initiate cognitive conflict;
• Use interactive experiences to help student teachers to grasp concepts;
• Use probing questions to make student teachers challenge their existing understanding.

In the following sections you will explore some of those strategies.

Figure 24. A group of tutors discuss inclusive questioning

Year 2 Semester 2: develop and sharpen students’ skills and competencies in the teaching of English at the basic level – develop the 4 language skills: listening, speaking, reading and writing; presenting skills lessons.  
Year 2 Semester 1 (Elective Literature): identifying and describing poetry, responding and analysing poetry.  
Year 3 Semester 1: develop further studies in grammar, comprehension and writing – being able to develop argumentative essays and debate; debating points raised by other side; features of debate.  
ECE 122: developing language and literacy; oral language development including: songs, rhymes, poems & verse; conversation; storytelling. Reading readiness and methodology of reading |
| Learning Outcomes for Tutors | By the end of the session tutors will be able to include strategies and questioning techniques in their classrooms to improve their students’ understanding of concepts and content. |

**Example**

Using Questions to Investigate Misconceptions in English Language Learning

Read the scenario below and then, in a group, discuss the possible strategies and questioning techniques Regina could use to improve her student teachers’ understanding of her lessons.

Regina asked her friend and peer, Freda, to observe her English Language lesson as she felt she was having problems getting her student teachers to talk. She felt they often did not understand her. So she asked Freda to focus on the questions she used in the classroom and how she responded to them.

Regina started her lesson immediately with no introduction or review of what had gone before. She was introducing a new activity to practise the language (‘can’ for ability) she had presented the day before. She gave the
instructions for the activity and then asked “do you understand?” All her student teachers said “Yes.” So she asked them to stand up and move around the classroom and talk to each other. She listened to the two students nearest to her who are always top in the English exams. They were doing the activity as Regina wanted. She was happy so went to sit at the front of the class to time the activity. After about 10 minutes she clapped her hands and asked them to sit down again. Then she asked the following questions:

“Who can play an instrument?”

“How can speak another language?”

The whole class shouted out different names. Regina smiled and said “Very good”, “Well done.” Then she asked:

“How has the most names on their sheet of paper?”

Several students shout out, “Me, I have 5, I have 7 etc.”

“Good, you are the winners!”

When the class was over Regina and Freda sat together to discuss the lesson. Here are some of the things Freda observed that she felt needed improving and was going to give feedback on.

Here are some of the things Freda will give feedback on:

• Clarity of introduction
• Clarity of instructions
• Variety of questioning techniques
• Checking understanding
• Monitoring
• No system of signals for students
• Listening and responding

Tutor Discussion

Do you agree with Freda’s observations? Why? Why not?

In pairs look at the list of things that need improving and write down the feedback you would give Regina. Use the table below where there are two already done for you.

<table>
<thead>
<tr>
<th>What needs improving</th>
<th>Feedback to Regina</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clarity of introduction</td>
<td></td>
</tr>
<tr>
<td>Clarity of instructions</td>
<td></td>
</tr>
<tr>
<td>Variety of questioning techniques</td>
<td></td>
</tr>
</tbody>
</table>
Checking understanding

If you ask the whole class, "Do you understand?" they will always say "Yes", so I suggest you check understanding by asking more questions and getting examples from your pupils so you can see how much they have understood.

Monitoring

No system of signals for students

Listening and responding

I think you can listen more actively because this will enable you to not just look for the answer you are expecting, but to alert you to unusual or innovative answers that you may not have expected. It also shows that you value the pupils’ thinking and therefore they are more likely to give thoughtful responses. Such answers could highlight misconceptions that need correcting, or they may show a new approach that you had not considered. ("I hadn’t thought of that. Tell me more about why you think that way.")

With your tutor colleagues, discuss how you might use this scenario with your own student teachers to raise awareness of the importance of questions for investigating misconceptions.

**T2-5 E 2 Plan and Practise together**

**Using Questions to Investigate Misconceptions in English Language Learning**

Before attempting to use lesson plans with your student teachers, it is a good idea to complete some activities using this teaching strategy yourself. It would be even better if you plan them and try them out with your tutor colleagues. Use the activity plan found in the Appendix.

In groups, think about which classes you will teach this week. What are some common misconceptions that your student teachers have about your subjects?
In your group, plan how you will use questions to investigate a common misconception in one of your lessons. Make specific reference to a piece of syllabus material or subject.

Please make sure that you have noted down everything you need to remember for your lesson in your activity plan.

**T2-5 E 3  Teach**

It is important for your professional learning that you actually teach the activity that you have planned. Please make sure that you have your activity plan to hand when you teach. Also make sure that you note down any issues that arose during the lesson immediately after you have taught. In particular, remember to fill in your observations section of the activity plan immediately after you have taught.

**T2-5 E 4  Reflect together**

**Using Questions to Investigate Misconceptions in English Language Learning**

Now that you have taught the lesson activity, reflect on how it went. In your reflection, look back at the ideas above, and then consider the following questions:

- What are the implications for your own professional learning, and for the education of student teachers?
- What measures can you put in place to avoid, as much as possible, misunderstanding and confusion of concepts and content?

Make a note of all the ideas and, if you have not done so already, try them out in another lesson.

Now, use your experience to make a poster for the common room wall! It will remind you on a daily basis of some useful teaching strategies to use in your classes.
Write down your thoughts and any specific outcomes from your reflection in your learning journal.
Teaching Strategy 5
Using Questions to Investigate Misconceptions in Mathematics Learning

<table>

<td>The tutor will learn how questions can be used to identify and address misconceptions of the student teachers.</td>
</tr>
</tbody>
</table>

T2-5 M 1 Example

Using Sets to Investigate Misconceptions

This is an example of an activity that uses simple questions to check learners’ understanding of the concept of sets, to identify misconceptions and to address these.

At the start of the lesson the tutor asks the student teachers to each gather a set of objects from inside the classroom. The student teachers are then put into groups and given the following instructions and questions:

- Put these objects into different sets. How do you know these are sets?
- Describe each set using mathematical language. How do you know your description makes sense?
- Compare the sets using mathematical language. How do you know your comparison is mathematically valid? How can you be sure?
- Re-organise the objects into different sets and repeat the instructions above. Make sure that in your explanations you use the words: elements, sets, equivalent sets, equal sets, disjoint, overlapping.
- Share your explanations and descriptions with the whole class.
Tutor Discussion: Anticipating Misconceptions

Student teachers will have misconceptions about many mathematical concepts. The issue as a tutor is to find out what these are so that they can be addressed.

- What do you think could be the misconceptions that the student teachers have about sets?
- What do you think are the advantages and disadvantages of organising the classroom like the tutor in the example did and asking these questions?

With your tutor colleagues, identify some classic misconceptions in mathematics that your student teachers could have. Then think of simple questions like the ones used in the example that you could ask the student teachers so that these misconceptions can come to light and be dealt with. Anticipating misconceptions will help you in planning effective lessons.

Make a note of your thoughts in your learning journal.

Plan and Practise together

Identifying and Dealing with Misconceptions

Before attempting to use the examples with your student teachers, it is a good idea to complete some activities using this teaching strategy yourself. It would be even better if you plan them and try them out with your tutor colleagues. Use the activity plan found in the Appendix.

Planning task: Plan an activity, with special emphasis on anticipating misconceptions on a mathematical topic you will teach next week.

With your tutor colleagues (if possible), write down misconceptions you anticipate your student teachers will have about a topic you will teach next week. Discuss simple but powerful questions you could ask in your lesson to identify and address these. On the activity plan write down the sequence of instructions you will give and questions you will ask your student teachers for that lesson.

Please make sure that you have noted down everything you need to remember for your lesson in your activity plan and refer to it during your lesson.
**T2-5 M 3 Teach**

It is important for your professional learning that you actually teach the activity you have planned. Please make sure you have your own activity plan available when you teach. Also make sure that you note down any issues that arose during the lesson immediately after you have taught. In particular, remember to fill in your observations section of the activity plan immediately after you have taught.

---

**T2-5 M 4 Reflect together**

**Are Questions Effective for Identifying and Addressing Misconceptions?**

Now that you have taught the lesson activity, reflect on how it went. If at all possible, do the reflection together with a colleague who has also tried the activity.

Reflection task: Were you, and your student teachers, able to identify misconceptions? Reflecting on how the lesson went, particularly the activities, instructions and questions you devised and asked, what worked and what did not work so well? Make a list of these in your learning journal. Next to it, write down what it was that made it work and any changes you would make to your lesson plan to make it an even better lesson.

In your learning journal, remember to write down any specific outcomes from your reflection. For example, what the most challenging aspect of identifying misconceptions through dialogue was. Also note down what you learned from this unit that was most effective in improving your teaching.

**T2-5 S 1 Example**

**Identifying and Addressing Misconceptions about Day and Night**

Appiah is a science tutor, and is planning to teach on ‘day and night’. The topic ‘The Solar System’ in the DBE syllabus (Year 1, Semester 1, Physics Section, Unit 4) deals with ‘formation of day and night’. The syllabus objective states that the students should demonstrate that the sun does not move. Instead, the Earth turns round and round. They also should be able to demonstrate day and night.

In the textbook, there is text about the sun rising in the east and setting in the west. The text talks about the day-time sky and the night-time sky. It mentions rotation. It shows an illustration of a model of the Earth – as a globe that spins at a tilt. This picture shows the kind of illustration.
Figure 25. Globe and torch

There is also a photograph in the textbook, taken from space, showing nighttime on part of Earth’s surface.

Appiah realises that his students have misconceptions. He knows he has to organise a practical demonstration of day and night. He wants to use using a model Earth and Sun. He wants to help the students to grasp the concept of the rotation of the Earth.

He starts with a question:

*How do you think day and night happens?*

Appiah has prepared a ‘globe and torch’ model’. He has set up a torch and a globe as in the picture. He uses a hand torch to provide a beam of light. This beam of light models the sunlight.

He spins the globe. The students observe. Does Ghana move as the globe spins?

He asks a series of questions about the model to help the student teachers notice what is happening as the globe spins:

- What happens when you spin the globe?
- Does the light shine onto the whole globe at the same time?
- How much of the globe did the light shine on at one time?
- How many African countries are in the light?
We say that one side of the globe is in ‘shadow’.

Look at the globe. This is what our earth looks like from space. He asks more questions:

- Are we able to spin the globe until Ghana is in the path of the beam from the torch?
- What does the dark area of the globe show? What do you think the bright part shows?
- What can we say about Ghana now? Is it day-time or night-time?
- What do you notice about Ghana as you turn the globe slowly on its axis?
- Why does one half of the globe not get light from the torch?

**Tutor Discussion**

Discuss with your tutor colleagues the questions tutor Appiah asked his student teachers. Compare and identify which of these would give you a good insight into the kind of misconceptions the student teachers have, and which ones would not give such a good insight. For example, compare the questions ‘How do you think day and night happens?’ and ‘Is it day-time or night-time?’

Discuss which questions you would keep if you were to teach this lesson, which you would change or not use and why. Remember the aim is to identify and then address misconceptions.

Make a note of your thoughts in your learning journal.

**T2-5 S2 Plan and Practise together**

**Identifying and Dealing with Misconceptions in Science Lessons**

Before attempting to use the examples with your student teachers, it is a good idea to complete some activities using this teaching strategy yourself. It would be even better if you plan them and try them out with your tutor colleagues. Use the activity plan found in the Appendix.

**Planning task:** Plan an activity, paying special attention to anticipating misconceptions on a science topic you will teach next week.

With your tutor colleagues identify a science topic you will teach next week. Discuss the misconceptions you think student teachers might have about
this topic. Brainstorm some questions based on the probable misconceptions that you identify. Make a note of these questions in the activity plan to use in the lesson you will take with your student teachers.

Please make sure that you have noted down everything you need to remember for your lesson in your activity plan and refer to it during your lesson.

![Figure 26. A model of the globe](image)

**T2-5 S 3 Teach**

It is important for your professional learning that you actually teach the activity that you have planned. Please make sure that you have your activity plan to hand when you teach. Also make sure that you note down any issues that arose during the lesson immediately after you have taught. In particular, remember to fill in your observations section of the activity plan immediately after you have taught.
Reflect together

Are Questions Effective for Identifying and Addressing Misconceptions?

Now that you have taught the lesson activity, reflect on how it went. If at all possible, do the reflection together with a colleague who has also tried the activity.

**Reflection task:** Were you, and your student teachers, able to identify misconceptions? Reflecting on how the lesson went, and the activities, instructions and questions you devised and asked: what worked and what did not work so well? Make a list of these in your learning journal. Next to it, write down what it was that made it work and any changes you would make to your lesson plan to make it an even better lesson.

In your learning journal, remember to write down any specific outcomes from your reflection. For example, what the most challenging aspect of identifying misconceptions through dialogue are. Also note down what you learned from this unit that was most effective in improving your teaching.
Theme 2: Questioning
Teaching Strategy 6
Involving everybody in Questioning

Usually, a tutor wants as many student teachers as possible to respond to questions. Also, it is important that all student teachers get an opportunity to answer both low and high level questions. Analysis of classroom interactions shows that it is often a minority of student teachers who dominate question and answer sessions. Some student teachers do not respond because they do not feel comfortable to do so. At other times, it is high-attaining student teachers who don’t participate in question and answer sessions.

To make sure all student teachers get the same excellent opportunities for learning, tutors need to have strategies for making all students participate in responding to questioning. Questioning should motivate all students, whatever their attainment, gender or background.

Here are some strategies to achieve this:

- **Selecting volunteers.** Asking student teachers who know the answer to raise their hands and selecting one who does not put up their hand to answer.
- **Random selection.** Writing the name of every student teacher on separate pieces of paper, putting them into a container; then pulling out a name (without looking) to select a student teacher to answer;
- **Tutor nominations (or “no hands up”).** Choosing specific student teachers to answer a question; selecting student teachers who generally volunteer as well as student teachers who avoid volunteering;
- **Student teacher nominations.** Asking a student teacher who has just answered to nominate the next speaker;
- **Talking tokens.** Giving 2-5 tokens per student teacher, depending on the duration of the activity or lesson; with every answer the student teacher gives up a token, ensuring that everybody has a chance to contribute;
- **Mini-blackboard display.** Student teachers writing answers on mini-blackboards and holding up the answers; selecting student teachers with different answers to share their answers and question this further;
- **Advance selection.** Telling student teachers who are less confident some of the questions that you will ask before the lesson; asking them to think of an answer and then selecting them for answering;
- **Eye contact.** Avoiding eye contact with dominant student teachers; making eye contact with shy student teachers indicates that an answer is expected;
- **Talking about participation.** Having a discussion that explains how participation is beneficial can eliminate fear of giving wrong answers; asking student teachers to suggest ideas that will increase participation, without compromising classroom management;
- **Criteria-based.** Setting a criterion to select student teachers for answering; for example, answer if “your name ends with s”, or “you are the first child in the family”, etc.

| Learning Outcomes for Tutors | By the end of the session tutors will be able to:  
                                    Use questions effectively to involve all student teachers in answering questions  
                                    Use a variety of teaching and learning strategies to get all student teachers involved  
                                    Plan a lesson plan using questioning techniques that involve all their student teachers. |

Example

Strategies for Involving everybody in Questioning for English Language Learning

Below are some of the techniques from the introduction to this teaching strategy. In pairs read through each technique and discuss the advantages and disadvantages for your teaching and learning context. Then fill in the table below.
Compare your ideas with another pair. In your new pair: Can you think of any other ways to involve everyone in questioning and answering? Think about your subject: English and English Literature. How might you be able to adapt some of these techniques?

- **Talking tokens.** Giving 2-5 tokens per student teacher, depending on the duration of the activity or lesson; with every answer the student teacher gives up a token, ensuring that everybody has a chance to contribute.

- **Mini-blackboard display.** Student teachers writing answers on mini-blackboards and holding up the answers; selecting student teachers with different answers to be questioned further about their answers.

- **Advance selection.** Telling less confident student teachers some of the questions to be asked, before the lesson; asking them to think of an answer and then selecting them for answering.

- **Eye contact.** Avoiding eye contact with student teachers who always answer; making eye contact with less confident student teachers indicates that an answer is expected.

- **Talking about participation.** Having a discussion that explains how participation is beneficial and can eliminate fear of wrong answers; asking student teachers to suggest ideas that will increase participation, without compromising discipline.

- **Criteria-based.** Setting a criterion to select student teachers for answering; for example, answer if, ‘your name ends with s’, or ‘you are the first child in the family’, etc.

Can you think of any other ways to ask questions and manage answers from student teachers?

**T2-6 E 2 Plan and Practise together**

**Involving everybody in Questioning for English Language Learning**

Using the activity plan found in the Appendix, think of a lesson that you have to teach this week. Plan how you will use at least one of the strategies above in your lessons. Make specific reference to a piece of syllabus material or subject. Before attempting to do an activity with your student teachers, it is a good idea to try the teaching strategy with your colleagues.

Please make sure that you have noted down everything you need to remember for your lesson in your activity plan and refer to it during your lesson.

**T2-6 E 3 Teach**

It is important for your professional learning that you actually teach the activity that you have planned. Please make sure that you have your activity plan to hand when you teach. Also make sure that you note down any issues that arose during the lesson immediately after you have taught. In particular, remember to fill in your observations section of the activity plan immediately after you have taught.

**T2-6 E 4 Reflect together**

**Involving everybody in Questioning for English Language Learning**

Now that you have taught the lesson activity, reflect on how it went. If at all possible, do the reflection together with a colleague who has also tried the activity. In your reflection, consider the following questions:

- Having used strategies listed in the Questioning theme, how do you think it has changed your teaching?

- How has it changed your attitude towards questioning?

- In your learning journal write down some of the changes you have made, specifically to do with how you use questioning to involve all in your classroom.

</tr>
</tbody>
</table>

**Example**

**Involving everybody in Questioning**

A tutor was concerned that some of the student teachers in her class were not being involved in responding to questions or taking part in class discussions. She decided to use some of the following strategies to encourage wider participation in her next lessons:

- **Selecting volunteers.** The tutor asked those student teachers who think they know the answer to raise their hands. This is an approach she has already used often. To increase participation she would increase the ‘wait time’ or ‘thinking time’ after each question and only then ask the student teachers to raise their hands to volunteer an answer.

- **‘No hands up’.** The tutor thought this could reduce the pressure for student teachers who feel intimidated by ‘hands up’ questioning. The tutor asked a question and said ‘no hands up’. She then asked the student teachers to discuss their answers first in groups or pairs. Then she chose a single student teacher or a group or a pair for the answer, allowing anyone in the group or pair to respond. This strategy involved more student teachers in preparing an answer to her question, which the tutor regarded as good.

- **Avoiding eye contact with dominant speakers.** Instead the tutor made eye contact with student teachers who were less confident - indicating that she expected them to respond and volunteer to answer.

- **Random selection.** The tutor wrote the name of each student teacher on a stick or strip of paper and kept these in a container. When she had asked a question she picked out one name at random. Once a student
teacher has answered a question their name was kept out of the container.

- **Student teacher nomination.** The tutor asked a student teacher a question. This student teacher was then allowed to nominate another student teacher to answer the next question.

- **Talking tokens.** The tutor gave each student teacher two cardboard tokens which they had to spend during the lesson by asking or answering questions.

- **Advance selection.** The tutor told some student teachers who were less confident and reluctant to answer the questions that she intended to ask them during the lesson in advance. This allowed them time to think about and plan their responses.

**Tutor Discussion**

In your tutor group discuss each of these strategies. Decide which would be most effective and which would be least effective in your own lessons. Additional ideas for involving everybody in questioning can be found in Extension Tasks below. Make a note of your thoughts in your learning journal.

---

**T2-6 M 2 Plan and Practise together**

**Planning to Involve everybody in Questioning**

Before attempting to use the examples with your student teachers, it is a good idea to complete some activities using this teaching strategy yourself. It would be even better if you plan them and try them out with your tutor colleagues. Make use of your own classroom experience to devise strategies that will enable you to involve all your student teachers in questioning in your lessons. Use the activity plan found in the Appendix.

---

**T2-6 M 3 Teach**

It is important for your professional learning that you actually teach the activity you have planned. Please make sure you have your own activity plan available when you teach. Also make sure that you note down any issues that arose during the lesson immediately after you have taught. In particular, remember to fill in your observations section of the activity plan immediately after you have taught.
Reflect together

How Easy Was It To Involve everybody?

Now that you have taught the lesson activity, reflect on how it went. If at all possible, do the reflection together with a colleague who has also tried the activity.

Reflection task 1: Classroom layout. Some students show a reluctance to become involved in class dialogue and use the classroom set-up not to be noticed. For example, by sitting at the back of the classroom. As a tutor you can take positive steps to ensure this doesn’t happen.

Discuss with other tutors how the layout of the classroom and the place where you stand in the room when teaching the class can help to ensure that quiet, less-confident students are not forgotten about. For example, is standing behind a table at the front of the classroom always the best position for a tutor to encourage whole-class participation?

Reflection task 2: Disadvantaged student teachers. For some student teachers, participation in class dialogue can be hampered by physical disability such as impaired hearing or impaired eyesight.

Discuss with other tutors what plans can be made in advance of teaching a class to ensure that no student teacher is disadvantaged or denied the opportunity for full participation in the class.

Remember to write down any specific outcomes from your reflection in your learning journal. Which strategies for involving whole-class discussion worked best? Also note down what you have learnt from this unit that was most effective in improving your teaching practice.

Extension tasks

Magic Microphone, Discussion and Role Reversal

If you want to take your questioning techniques further, here are two extension tasks that you can use for further discussion, either during the PD session or with colleagues in your own time.

Extension task 1: Magic microphone. Devise an activity using a ‘magic microphone’ to encourage the whole group of student teachers to become involved in asking and answering questions.

An actual microphone (which is not connected) or a model made from something like a short length of brush handle will give the activity more appeal.
The microphone will be passed between student teachers in the class. Each student teacher who receives it must ask another student teacher a question about a mathematical topic that you will be teaching. This could be supported by another student teacher writing the questions, or a spider diagram, on the board.

Reflection: Was the lesson using a ‘magic microphone’ successful? Did it encourage student teachers in your class, whom you know to be rather reserved and reluctant to respond, to be more outgoing? Discuss with other tutors how you were able to encourage your student teachers to become more involved.

As a result of using the ‘magic microphone’ strategy did you or your colleagues have any ideas about how the strategy could be modified, or if a similar but different strategy could be used to encourage student teacher participation?

**Extension task 2: Prompting class discussion.** Plan a lesson on a topic you will be teaching this week.

In your lesson plan, mark down places where you intend to pause for class discussions. Make a note of the questions you will ask student teachers and what your strategy will be to promote a whole-class discussion of the lesson content. Leave space on your lesson plan to note down any unexpected student teacher responses or responses that indicate a lack of understanding that you might take into account when adapting your lesson plan for future use.

**Extension task 3: Role reversal.** Role reversal can provide a means of stimulating class dialogue. Organise an activity in which groups of student teachers are required to teach the rest of the class about different aspects of one mathematical concept or topic.

For this activity you, the tutor, should take your place at an empty desk with the rest of the student teachers. This will give you a ‘student teacher’s eye’ view of teaching and will increase your awareness of issues e.g. how easy it is to see the board from different parts of the room, or how well sounds travel from the front to the back of the room.

At the end of each group’s presentation you should ask a question or two in order to stimulate other student teachers to ask questions. The idea is to encourage dialogue between the ‘teachers’ and the ‘students’.

Example

Involving everybody in Questioning while Teaching how to Measure the Volume of Irregular Solids

Tutor Eunice is an experienced science tutor who loves teaching science using laboratory equipment because she believes this is an effective way to ensure that students understand scientific principles. However, the class is large and there is normally only just enough equipment for one ‘demonstration’ of the scientific experiment. Over the years, Eunice has developed strategies to involve her student teachers actively in these demonstrations by asking open questions, inviting the student teachers to show and not just say what they are thinking by using the equipment, and even asking groups of student teachers to prepare and co-teach the lesson with her. Still, she has noticed that she always asks the same type of student teachers: those that are confident and volunteer a lot of answers. She has also noticed they tend to be male, and fluent in speaking English and Twi.

Eunice wants to change this in order to give everybody in her class the same opportunities for learning, something her student teachers should also do when they are teaching in schools. She examines the list of approaches suggested in the introduction of this ‘involving everybody in questioning’ strategy to select two she will focus on in her next lesson. She only wants to focus on two because she prefers to make step by step changes to her teaching that she can reflect properly on their effect. The topic of that
lesson is how to measure the volume of irregular solids. She selects the following approaches and writes these in her activity plan:

- **Talking about participation.** Having a discussion that explains how participation is beneficial and can eliminate the fear of giving wrong answers; asking student teachers to suggest ideas that will increase participation, without compromising classroom management;

- **Random selection.** Writing the name of every student teacher on a piece of paper, putting them into a container; then pulling out a name (without looking) to select a student teacher to answer. Because Eunice does not know who will be present in the lesson, she asks each student teacher to write their name on strips of paper she has prepared and drop it in a plastic container.

**Tutor Discussion**

With your tutor colleagues discuss the approach tutor Eunice takes to work on changing her practice. Would you make small steps using some of the ideas you read or hear about, or would you approach it differently? Can you also give specific examples of where you in your teaching could use the approaches that tutor Eunice used to involve all in questioning?

**Plan and Practise together**

**Involving everybody in Questioning for Science Learning**

Before attempting to use the examples with your student teachers, it is a good idea to complete some activities using this teaching strategy yourself. It would be even better if you plan them and try them out with your tutor colleagues. Use the activity plan found in the Appendix.

With your tutor colleagues, think of a lesson that you have to teach this week. Plan how you will use at least one of the strategies that you can find in the introduction section of this teaching approach ‘Involving All In Questioning’ in your lessons. Make specific reference to a piece of syllabus material or subject.

Please make sure that you have noted down everything you need to remember for your lesson in your activity plan and refer to it during your lesson.
Teach

It is important for your professional learning that you actually teach the activity that you have planned. Please make sure that you have your activity plan to hand when you teach. Also make sure that you note down any issues that arose during the lesson immediately after you have taught. In particular, remember to fill in your observations section of the activity plan immediately after you have taught.

Reflect together

Involving everybody in Questioning for Science Learning

Now that you have taught the lesson activity, reflect on how it went. If at all possible, do the reflection together with a colleague who has also tried the activity. In your reflection, consider the following questions:

Having used strategies listed in the Questioning theme how do you think it has changed your teaching?

How has it changed your attitude towards questioning?

In your learning journal write down some of the changes you have made, specifically to do with how you use questioning to involve all in your classroom.
